**Sieve Extensions: MIME Bodypart Iteration, MIME Tests, Replacement and  
Enclosure  
draft-hansen-sieve-loop-01.txt**

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on April 26, 2006.

Abstract

The current Sieve language has no looping mechanism, a way to look at individual MIME parts, or any way to manipulate those individual parts. This document defines extensions for each of these needs.

Note

This document is being discussed in the MTA-FILTERS mailing lists, [ietf-mta-filters@imc.org](mailto:ietf-mta-filters@imc.org).

## **1. Introduction**

Sieve scripts are used to make decisions about the disposition of a mail message. The original Sieve spec, [4], defined operators for looking at the message headers, such as addresses and the subject. Other extensions provide access to the body of the message, or allow you to manipulate the header of the message. But none of these extensions take into account that MIME messages ([1]) are often complex objects, consisting of many parts and sub-parts. This extension defines mechanisms for looping through the MIME body parts, performing tests on each body part, changing the contents of a body part, and enclosing the message with a wrapper.

## **2. Sieve Loops**

The current Sieve language has no looping mechanism. Given that messages may contain multiple attachments, in order to support filters that apply to any and all attachments, we introduce a new control command: "for.every.part", which is an iterator that walks through every MIME part of a message, including nested parts, and applies the specified block to each of them. The iterator will start with the first MIME part (as its current context) and will execute a command block (Sieve commands enclosed by { ...}). Upon completion of this command block, the iterator advances to the next MIME part (as its current context) and executes the same command block again.

The iterator can be terminated prematurely by a new sieve command, "break".

Syntax: for.every.part block

Syntax: break;

## **3. Test "mime"**

Syntax: mime [COMPARATOR] [MATCH-TYPE] <header-names: string-list>  
[<parameter-names: string-list>] <key-list: string-list>

Syntax: mime [:filename] ...

Syntax: mime [:type] ...

Syntax: mime [:subtype] ...

For Sieve tests on MIME parts, a new Sieve test ("mime") is defined. Similar in concept to the Sieve "header" test, it will parse the MIME header lines so that tests can be performed on specific elements.

If used within the context of a "for.every.part" iterator, the "mime" test will examine the headers associated with the current MIME part context.

If used outside the context of a "for.every.part" iterator, the "mime" test will examine all MIME body parts and return true if any of them satisfies the test.

The "mime" test has all of the options available from the header test, [\[4\] section 5.7](#). In addition, these options are available:

:filename examines the "Content-Disposition:" header field for its "filename" parameter. If there is no "Content-Disposition:" header field, then it will look at the "Content-Type:" header field for the "name" parameter.

:type examines the "Content-Type:" header field type parameter.

:subtype examines the "Content-Type:" header field subtype parameter.

#### **4. Action Replace**

Syntax: replace string

A new sieve action command is defined to allow the MIME part to be replaced by a text message. The "replace" command causes a MIME part to be removed and replaced with a text/plain part with the text supplied by the command.

When used in the context of a "for.every.part" loop, the MIME part to be replaced is the "current" MIME part. If the current MIME context is a multipart MIME part, the entire multipart MIME part is replaced. (Replacing a non-multipart MIME part within a "for.every.part" loop context does not alter the overall message structure.)

When used outside the context of a "for.every.part" loop, the MIME part to be replaced is the entire message.

## **5. Action Enclose**

Syntax: `enclose <:subject string> <:headers string-list> string`

A new sieve action command is defined to allow an entire message to be enclosed as an attachment to a new message. This `enclose` action takes precedence over all other message modifications, such as `"replace"`. If multiple `"enclose"` actions are executed by a script, only the text specified on the last one is used when creating the enclosed message. This action does not affect messages that are forwarded via a `"redirect"` action.

Specifically, the original message becomes a multipart/mixed message with two parts: a text/plain portion with the string argument as its body, and a message/rfc822 portion with the original message enclosed. The Content-Type: header field becomes multipart/mixed. The Subject: header is specified by the `:subject` argument. Any headers specified by `:headers` are copied from the old message into the new message.

## **6. Sieve Capability Strings**

A Sieve implementation that defines the `"for.every.part"` and `"break"` actions will advertise the capability string `"for.every.part"`.

A Sieve implementation that defines the `"mime"` test will advertise the capability string `"mime"`.

A Sieve implementation that defines the `"replace"` action will advertise the capability string `"replace"`.

A Sieve implementation that defines the `"enclose"` action will advertise the capability string `"enclose"`.

## **7. Examples**

### **7.1. Example 1**

A Sieve script to replace all the Windows executable attachments in a message would be:

```
require [ "for.every.part", "mime", "replace" ];
for.every.part {
    if ( anyof ( mime :subtype :is "exe", mime :filename :matches "*.com" )
{
    replace "Executable attachment removed by user filter";
}
```

```
}
```

## 7.2. Example 2

A Sieve script to warn the user about executable attachment types would be:

```
require [ "for.every.part", "mime", "enclose" ];

for.every.part {
    if mime :filename :matches [ "*.com", "*.exe", "*.vbs", "*.scr",
                                  "*.pif", "*.hta", "*.bat", "*.zip" ] {
        # these attachment types are executable
        enclose :subject "Warning" "
WARNING! The enclosed message contains executable attachments.
These attachments types may contain a computer virus program
that can infect your computer and potentially damage your data

Before clicking on these message attachments, you should verify with
the sender that this message was sent by them and not a computer virus.
";
        break;
    }
}
```

## 8. Security Considerations

To be provided

## 9. IANA Considerations

To be provided
