**YANG Data Model for MPLS-based L2VPN  
draft-ietf-bess-l2vpn-yang-07.txt**

Abstract

This document describes a YANG data model for Layer 2 VPN (L2VPN) services over MPLS networks. These services include point-to-point Virtual Private Wire Service (VPWS) and multipoint Virtual Private LAN service (VPLS) that uses LDP and BGP signaled Pseudowires. It is expected that this model will be used by the management tools run by the network operators in order to manage and monitor the network resources that they use to deliver L2VPN services.

This document also describes the YANG data model for the Pseudowires. The independent definition of the Pseudowires facilitates its use in Ethernet Segment and EVPN data models defined in separate document.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 3, 2018.

## **1. Introduction**

The Network Configuration Protocol (NETCONF) [[RFC6241](#)] is a network management protocol that defines mechanisms to manage network devices. YANG [[RFC6020](#)] is a modular language that represents data structures in an XML or JSON tree format, and is used as a data modeling language for the NETCONF.

This document defines a YANG data model for MPLS based Layer 2 VPN services (L2VPN) [[RFC4664](#)] and includes switching between the local attachment circuits. The L2VPN model covers point-to-point VPWS and Multipoint VPLS services. These services use signaling of Pseudowires across MPLS networks using LDP [[RFC4447](#)][[RFC4762](#)] or BGP[[RFC4761](#)].

Initially, the data model covers Ethernet based Layer 2 services. The Ethernet Attachment Circuits are not defined. Instead, they are leveraged from other standards organizations such as IEEE802.1 and Metro Ethernet Forum (MEF).

Other Layer 2 services, such as ATM, Frame Relay, TDM, etc are included in the scope but will be covered as the future work items.

The objective of the model is to define building blocks that can be easily assembled in different order to realize different services.

The data model uses following constructs for configuration and management:

- o Configuration
- o Operational State
- o Executables (Actions)
- o Notifications

The current document focuses on definition of configuration, state and notification objects.

The L2VPN data object model uses the instance centric approach. Within an L2VPN instance; a set of common parameters, a list of PWs and a list of endpoints are defined. A special constraint is added for the VPWS configuration such that only two endpoints are allowed in the list of endpoints.

The Pseudowire data object model is defined independent of the L2VPN data object model to allow its inclusion in the Ethernet Segment and EVPN data objects.

The L2VPN data object model augments Psuedowire data object for its definition.

The document also includes Notifications used by the L2VPN object model

## **2. Specification of Requirements**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

## **3. L2VPN YANG Model**

### **3.1. Overview**

In this version of the document, for configuration, one single container, l2vpn, is defined. Within the l2vpn container, common parameters and a list of endpoints are defined. For the point-to-point VPWS configuration, endpoint list is used with the constraint that limits the number of endpoints to be two. For the multipoint service, endpoint list is used. Each endpoint contains the common definition that is either an attachment circuit, a pseudowire or a redundancy group. The YANG data model for l2vpn in this document is greatly simplified by by removing separate definition of endpoint-a and endpoint-z that was specific for VPWS service in the previous versions. The same endpoint list is used by both the VPLS and VPWS service with the exception that VPWS uses only two entries.

The l2vpn container also includes definition of common building blocks for redundancy-grp templates and pseudowire-templates.

The State objects have been consolidated with the configuration object as per the recommendations provided by the Guidelines for Yang Module Authors document.

The IETF working group has defined the VPWS and VPLS services that leverages the pseudowire technologies defined by the PWE3 working group. A large number of RFCs from these working groups cover this subject matter. Hence, it is prudent that this document state the scope of the MPLS L2VPN object model definitions.

The following documents are within the scope. This is not an exhaustive list but a representation of documents that are covered for this work:

- o Requirements for Pseudo-wire Emulation Edge-to-Edge (PWE3) [[RFC3916](#)]
- o Pseudo-wire Emulation Edge-to-Edge (PWE3) Architecture [[RFC3985](#)]
- o IANA Allocations for Pseudowire Edge to Edge Emulation (PWE3) [[RFC4446](#)]
- o Pseudowire Setup and Maintenance Using the Label Distribution Protocol (LDP) [[RFC4447](#)]
- o Encapsulation Methods for Transport of Ethernet over MPLS Networks [[RFC4448](#)]
- o Pseudowire Emulation Edge-to-Edge (PWE3) Control Word for Use over an MPLS PSN [[RFC4385](#)]
- o Requirements for Multi-Segment Pseudowire Emulation Edge-to-Edge (PWE3) [[RFC5254](#)]
- o An Architecture for Multi-Segment Pseudowire Emulation Edge-to-Edge [[RFC5659](#)]
- o Segmented Pseudowire [[RFC6073](#)]
- o Framework for Layer 2 Virtual Private Networks [[RFC4664](#)]
- o Service Requirements for Layer 2 Provider-Provisioned Virtual Private Networks [[RFC4665](#)]
- o Virtual Private LAN Service (VPLS) Using BGP for Auto-Discovery and Signaling [[RFC4761](#)]
- o Virtual Private LAN Service (VPLS) Using Label Distribution Protocol (LDP) Signaling [[RFC4762](#)]
- o Attachment Individual Identifier (AII) Types for Aggregation [[RFC5003](#)]
- o Provisioning, Auto-Discovery, and Signaling in Layer 2 Virtual Private Networks (L2VPNs) [[RFC6074](#)]
- o Flow-Aware Transport of Pseudowires over an MPLS Packet Switched Network [[RFC6391](#)]

- o Layer 2 Virtual Private Networks Using BGP for Auto-Discovery and Signaling [[RFC6624](#)]
- o Extensions to the Virtual Private LAN Service (VPLS) Provider Edge (PE) Model for Provider Backbone Bridging [[RFC7041](#)]
- o LDP Extensions for Optimized MAC Address Withdrawal in a Hierarchical Virtual Private LAN Service (H-VPLS) [[RFC7361](#)]
- o Using the generic associated channel label for Pseudowire in the MPLS Transport Profile [[RFC6423](#)]
- o Pseudowire status for static pseudowire [[RFC6478](#)]

The specifics of pseudowire over MPLS-TP LSPs is in scope. However, the initial effort addresses definitions of object models that are commonly deployed.

The IETF work in L2VPN and PWE3 working group relating to L2TP, OAM, multicast (e.g. p2mp, etree, etc) and access specific protocols such as G.8032, MSTP, etc is out-of-scope for this document.

The following is the high level view of the L2VPN data model.

```
PW // Container
    PW specific attributes

    PW template definition

template-ref Redundancy-Group // redundancy-group
    template
    attributes

l2vpn-instances // container

    common attributes

    BGP-parameters // container
        common attributes
        auto-discovery attributes
        signaling attributes

    // list of PWs being used
    PW // container
        template-ref PW
        attribute-override

    PBB-parameters // container
        pbb specific attributes

    VPWS-constraints // rule to limit number of endpoints to two

    // List of endpoints, where each member endpoint container is -
    PW // reference
    redundancy-grp // container
        AC // eventual reference to standard AC
        PW // reference
```

Figure 1

### **3.2. Open issues and next steps**

Most of the open issues have been resolved in this document. There are some items for considerations, such as PW headend, VPLS IRB. These may or may not be covered in this document. If the working group intends these topics be addressed in a separate document, authors will proceed to finalize this document with comments received on the definitions included in the current document.

### **3.3. Pseudowire Common**

#### **3.3.1. Pseudowire**

Pseudowire definitions is moved to a seperate container in order to allow Ethernet Segment and EVPN models can refer without having to pull down L2VPN container.

#### **3.3.2. pw-templates**

The pw-templates container contains a list of pw-template. Each pw-template defines a list of common pseudowire attributes such as PW MTU, control word support etc.

### **3.4. L2VPN Common**

#### **3.4.1. redundancy-group-templates**

The redundancy-group-template contains a list of templates. Each template defines common attributes related to redundancy such as protection mode, reversion parameters, etc.

### **3.5. L2VPN instance**

A list of L2VPN instance is defined where each entry represent a point to point or multipoint service. Within a service instance, a set of common attributes are defined, followed by a list of PWs and a list of endpoints.

#### **3.5.1. common attributes**

The common attributes apply to entire L2VPN instance. These attributes typically include attributes such as mac-aging-timer, BGP related parameters (if using BGP signaling), discovery-type, etc.

#### **3.5.2. PW list**

The PW list is the number of PWs that are being used for a given L2VPN instance. Each PW entry refers to PW template to inherit common attributes for the PW. The one or more attributes from the template can be overridden. It further extends definitions of more PW specific attributes such as use of control word, mac withdraw, what type of signaling (i.e. LDP or BGP), setting of the TTL, etc.

### **3.5.3. List of endpoints**

The list of endpoints define the characteristics of the L2VPN service. In the case of VPWS, the list is limited to two entries while for VPLS, there could be many.

Each entry in the endpoint list, may hold AC, PW or redundancy-grp references. The core aspect of endpoint container is its flexible personality based on what user decides to include in it. It is future-proofed with possible extensions that can be included in the endpoint container such as Integrated Route Bridging (IRB), PW Headend, Virtual Switch Instance, etc.

The endpoint entry also defines the split-horizon attribute which defines the frame forwarding restrictions between the endpoints belonging to same split-horizon group. This construct permits multiple instances of split horizon groups with its own endpoint members. The frame forwarding restrictions does not apply between endpoints that belong to two different split horizon groups.

#### **3.5.3.1. ac**

Attachment Circuit (AC) resides within endpoint entry either as an independent entity or as a member of the redundancy group. AC is not defined in this document but references the definitions being specified by other working groups and standard bodies.

#### **3.5.3.2. pw**

The Pseudo-wire resides within endpoint entry either as an independent entity or as a member of the redundancy group. The PW refers to one of the entry in the list of PWs defined with the L2VPN instance.

#### **3.5.3.3. redundancy-grp choice**

The redundancy-grp is a generic redundancy construct which can hold primary and backup members of AC and PWs. This flexibility permits combinations of -

- o primary and backup AC
- o primary and backup PW
- o primary AC and backup PW
- o primary PW and backup AC

The redundancy group also defines attributes of the type of redundancy, such as protection mode, reroute mode, reversion related parameters, etc.

#### **3.5.4. point-to-point or multipoint service**

The point-to-point service as defined for VPWS is represented by a list of endpoints and is limited to two entries by the VPWS constrain rules

The multipoint service as defined for VPLS is represented by a list of endpoints.

The augmentation of ietf-l2vpn module is TBD. All IP addresses defined in this module are currently scoped under global VRF/table.

#### **3.6. Operational State**

The operational state of L2VPN attributes has been consolidated with the configuration as per recommendations from the guidelines for the YANG author document.

#### **3.7. Yang tree**

#### 4. YANG Module

The L2VPN configuration container is logically divided into following high level config areas:

```

<CODE BEGINS> file "ietf-pseudowires@2017-06-26.yang"
module ietf-pseudowires {
  namespace "urn:ietf:params:xml:ns:yang:ietf-pseudowires";
  prefix "pw";

  import ietf-inet-types {
    prefix "inet";
  }
}

```

```
import ietf-routing-types {
  prefix "rt-types";
}

organization "ietf";
contact      "ietf";
description  "Pseudowire YANG model";

revision "2017-06-26" {
  description "Initial revision " +
    " - Created a new model for pseudowires, which used " +
```

```
        "    to be defined within the L2VPN model " +
        """;
reference """;
}

/* Typedefs */

typedef pseudowire-ref {
  type leafref {
    path "/pw:pseudowires/pw:pseudowire/pw:name";
  }
  description "A type that is a reference to a pseudowire";
}

typedef pw-template-ref {
  type leafref {
    path "/pw:pseudowires/pw:pw-templates/pw:pw-template/pw:name";
  }
  description "A type that is a reference to a pw-template";
}

typedef cw-negotiation-type {
  type enumeration {
    enum "non-preferred" {
      description "No preference for control-word";
    }

## 5. Security Considerations

The configuration, state, action and notification data defined in this document are designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [RFC6242]. The NETCONF access control model [RFC6536] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

The security concerns listed above are, however, no different than faced by other routing protocols. Hence, this draft does not change any underlying security issues inherent in [I-D.ietf-netmod-routing-cfg]

## 6. IANA Considerations

None.

## 7. Acknowledgments

The authors would like to acknowledge Giles Heron and others for their useful comments.

## [Appendix A](#). Example Configuration

This section shows an example configuration using the YANG data model defined in the document.

## [Appendix B](#). Contributors

The editors gratefully acknowledge the following people for their contributions to this document.
