**YANG Data Model for TE Topologies  
draft-liu-teas-yang-te-topo-01**

Abstract

This document defines a YANG data model for representing and manipulating TE Topologies.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 26, 2015.

**1. Introduction**

YANG [[RFC6020](#)] a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [[RFC6241](#)]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. ReST) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interface, such as CLI and programmatic APIs. This document defines a YANG data model for representing and manipulating TE Topologies. This model contains technology agnostic TE Topology building blocks that can be augmented and used by other technology-specific TE Topology models.

**1.1. Tree Structure - Legend**

A simplified graphical representation of the data model is presented in [Section 3](#) of this document. The following notations are used for the YANG model data tree representation.

<status> <flags> <name> <opts> <type>

<status> is one of:

- + for current
- x for deprecated
- o for obsolete

<flags> is one of:

- rw for read-write configuration data
- ro for read-only non-configuration data
- x for execution rpcs
- n for notifications

<name> is the name of the node

If the node is augmented into the tree from another module, its name is printed as <prefix>:<name>

<opts> is one of:

- ? for an optional leaf or node
- ! for a presence container
- \* for a leaf-list or list
- Brackets [<keys>] for a list's keys
- Curly braces {<condition>} for optional feature that make node conditional
- Colon : for marking case nodes
- Ellipses ("...") subtree contents not shown

Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").

<type> is the name of the type for leafs and leaf-lists.

### 1.2. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]

Table 1: Prefixes and corresponding YANG modules

### **1.3. Terminology**

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[RFC2119](#)].

## **2. Design Considerations**

### **2.1. Generic extensible Model**

The TE Topology model proposed in this document is meant to be technology agnostic. Other technology specific TE Topology models can augment and use the building blocks provided by the proposed model.

#### **2.1.1. Generic TE Link Attributes**

The model covers the definitions for generic TE Link attributes - bandwidth, admin groups, SRLGs, switching capabilities, TE metric extensions etc.

#### **2.1.2. Generic TE Node Attributes**

The model covers the definitions for generic TE Node attributes like connectivity matrix.

```

+--rw connectivity-matrix* [id]
  +--rw id                uint32
  +--rw from-link
    +--rw topo-ref?      leafref
    +--rw node-ref?     leafref
    +--rw link-end-ref? leafref
  +--rw to-link
    +--rw topo-ref?      leafref
    +--rw node-ref?     leafref
    +--rw link-end-ref? leafref
  +--rw is-allowed?     Boolean

```

#### **2.1.3. TED Information Sources**

The model allows each TE topological element to have multiple TE information sources (OSPF-TE, ISIS-TE, BGP-LS, User-Configured, Other). Each information source is associated with a credibility preference to indicate precedence.

The model captures overlay and underlay relationship for TE nodes/links. For example - in networks where multiple TE Topologies are

built hierarchically, this model allows the user to start from a specific topological element in the top most topology and traverse all the way down to the supporting topological elements in the bottom most topology.

## **2.2. Overlay/Underlay Relationship**

```

+--rw node* [te-node-id]
  :
  +--rw te-node-attributes
    :
    +--rw underlay-topology? leafref {te-topology-hierarchy}?

+--rw link* [source-te-node-id source-te-link-id dest-te-node-id
             dest-te-link-id]
  :
  +--rw te-link-attributes
    +--rw underlay! {te-topology-hierarchy}?
      +--rw underlay-path
        :
        +--rw underlay-backup-path
          :
          +--rw underlay-protection-type? uint16
        +--rw underlay-trail-src
          :
          +--rw underlay-trail-des
            :

```

## **2.3. Scheduling Parameters**

The model allows time scheduling parameters to be specified for each topological element. These parameters allow the provider to present different topological views to the client at different time slots.

```

+--rw schedules* [schedule-id]
| +--rw schedule-id          uint32
| +--rw start?              yang:date-and-time
| +--rw schedule-duration?  string
| +--rw repeat-interval?    string

```

## **2.4. Abstract TE Topologies**

The model allows the provider to present the network in abstract terms on per client basis and facilitates the notion of "TE Topology as a service". These topologies are typically decoupled from the actual network topology and are supposed to be fully comprehensible by the clients and contain sufficient information for the client path

computers to select service paths according to the client policies. The model also allows the client to request changes to the abstract TE Topology that is presented to it and thus manipulate it.

### 2.5. Open Items

- o Relationship with "generic network topology" model: The generic network topology building blocks are discussed in [YANG-NET-TOPO]. This version of the document does not use any of those building blocks. The authors would like to explore the possibility of doing that in future revisions of this document.
- o Incremental notifications: The model proposed in this version does not cover incremental notifications. The authors intend to add this in future revisions of the document.

## 3. Tree Structure

description
    "TE link is a logical construct that represents a way
    to group/map information about certain physical
    resources (and their properties) that interconnect TE
    nodes.
    A Network Link connects a by Local (Source) node and
    a Remote (Destination) Network Nodes via a set of the
    nodes' TE links.
    As it is possible to have several links between the
    same source and destination nodes, and as a link
    could potentially be re-homed, to ensure that we
    would always know to distinguish between
    links, every link is identified by a dedicated link
    identifier.
    Note that a link models a point-to-point link, not a
    multipoint link.";
