Yang Data Model for ISIS protocol
draft-litkowski-isis-yang-isis-cfg-01

Abstract

This document defines a YANG data model that can be used to configure and manage ISIS protocol.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 29, 2014.

1. Introduction

This document defines a YANG data model for ISIS routing protocol.

The data model covers configuration of an ISIS routing protocol instance as well as operational states.

1.1. Tree diagram

A simplified graphical representation of the data model is presented in Section 2. The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- o Abbreviations before data node names: "rw" means configuration data (read-write), and "ro" means state data (read-only).
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").

- o Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Design of the data model

The ISIS Yang module is divided in two main containers :

- o isis-cfg : that contains writable configuration objects.
- o isis-state : that contains read-only states.

The container isis-cfg and isis-state are augmenting the "routing-protocol" lists in ietf-routing module with specific ISIS parameters.

The figure below describe the overall structure of the isis Yang module :

```

module: isis
augment /rt:routing-state/rt:ribs/rt:rib/rt:routes/rt:route:
  +--ro metric?          uint32
  +--ro tag*             uint32
  +--ro route-type?     enumeration

augment /rt:active-route/rt:output/rt:route:
  +--ro metric?          uint32
  +--ro tag*             uint32
  +--ro route-type?     enumeration

augment
  /rt:routing/rt:routing-instance/rt:routing-protocols/rt:routing-protocol:
    +--rw isis
      +--rw isis-level?          isis-level
      +--rw nsap-address         simple-iso-address
      +--rw ipv4-router-id?      inet:ipv4-address
      +--rw ipv6-router-id?      inet:ipv6-address
      +--rw reference-bandwidth? uint32
      +--rw lsp-mtu?             uint16
      +--rw lsp-lifetime?        uint16
      +--rw lsp-refresh?         uint16
      +--rw psnp-authentication? boolean
      +--rw csnp-authentication? boolean
      +--rw hello-authentication? boolean
      +--rw authentication-key?  string
      +--rw authentication-type? enumeration
      +--rw isis-multi-topology-cfg
      |   ...
      +--rw isis-level-1-cfg
      |   ...

```

```

    +--rw isis-level-2-cfg
    |   ...
    +--rw overload
    |   +--rw status?      boolean
    |   +--rw timeout?     uint16
    +--rw interfaces
    |   +--rw interface* [name]
    |   ...

augment
/rt:routing-state/rt:routing-instance/rt:routing-protocols/rt:routing-protocol:
  +--ro isis-state
  |   +--ro adjacencies
  |   |   +--ro adjacency* [interface]
  |   |   |   +--ro interface      string
  |   |   |   +--ro level?         isis-level
  |   |   |   +--ro state?         enumeration
  |   +--ro spf-log
  |   |   +--ro event* [id]
  |   |   |   +--ro id              uint32
  |   |   |   +--ro spf-type?       enumeration
  |   |   |   +--ro level?          isis-level
  |   |   |   +--ro spf-delay?      uint32
  |   |   |   +--ro schedule-timestamp? yang:timestamp
  |   |   |   +--ro start-timestamp? yang:timestamp
  |   |   |   +--ro end-timestamp?  yang:timestamp
  |   |   |   +--ro trigger-lsp* [lsp]
  |   |   |   |   +--ro lsp          isis-lsp-id
  |   |   |   |   +--ro sequence?   uint32
  |   +--ro lsp-log
  |   |   +--ro event* [id]
  |   |   |   +--ro id              uint32
  |   |   |   +--ro level?          isis-level
  |   |   |   +--ro lsp
  |   |   |   |   +--ro lsp?         isis-lsp-id
  |   |   |   |   +--ro sequence?   uint32
  |   |   |   +--ro received-timestamp? yang:timestamp
  |   +--ro database
  |   |   +--ro level-1
  |   |   |   ...
  |   |   +--ro level-2
  |   |   |   ...
  |   +--ro hostnames
  |   |   +--ro hostname* [system-id]
  |   |   |   +--ro system-id       isis-system-id
  |   |   |   +--ro hostname?      string

```

2.1. ISIS configuration

The ISIS configuration container is divided in :

- o Global parameters.
- o Level specific parameters (see Section 2.3).
- o Per interface configuration (see Section 2.4).

2.2. Multitopology parameters

The multitopology section is used to enable support of MT extensions for specific address families.

A boolean is associated with each topology type, defining if the topology is enabled or not.

```

+--rw isis-multi-topology-cfg
|   +--rw ipv4-unicast?      boolean
|   +--rw ipv6-unicast?      boolean
|   +--rw ipv4-multicast?    boolean
|   +--rw ipv6-multicast?    boolean
```

2.3. Per level parameters

The level parameter section of the ISIS instance describes the global parameters for level 1 and 2 including authentication, protocol preferences, default metrics ...

Level specific parameters override parameters contained directly under isis-cfg container.

```

+--rw isis-level-1-cfg
|   +--rw enabled?                boolean
|   +--rw psnp-authentication?    boolean
|   +--rw csnp-authentication?    boolean
|   +--rw hello-authentication?   boolean
|   +--rw authentication-key?     string
|   +--rw authentication-type?    enumeration
|   +--rw metric-type?            enumeration
|   +--rw preference?             uint8
|   +--rw external-preference?    uint8
|   +--rw default-ipv4-unicast-metric? isis-wide-metric
|   +--rw default-ipv6-unicast-metric? isis-wide-metric
|   +--rw default-ipv4-multicast-metric? isis-wide-metric
|   +--rw default-ipv6-multicast-metric? isis-wide-metric
+--rw isis-level-2-cfg
|   +--rw enabled?                boolean
|   +--rw psnp-authentication?    boolean
|   +--rw csnp-authentication?    boolean
|   +--rw hello-authentication?   boolean
|   +--rw authentication-key?     string
|   +--rw authentication-type?    enumeration
|   +--rw metric-type?            enumeration
|   +--rw preference?             uint8
|   +--rw external-preference?    uint8
|   +--rw default-ipv4-unicast-metric? isis-wide-metric
|   +--rw default-ipv6-unicast-metric? isis-wide-metric
|   +--rw default-ipv4-multicast-metric? isis-wide-metric
|   +--rw default-ipv6-multicast-metric? isis-wide-metric

```

2.4. Per interface parameters

The per-interface section of the ISIS instance describes the interface specific parameters.

Each interface has interface-specific parameters and level-specific parameters. A level-specific parameter always override interface-specific parameter and an interface-specific parameter always override an isis global parameter (defined in isis-cfg).

```

+--rw interfaces
|   +--rw interface* [name]
|       +--rw name                leafref
|       +--rw level?              isis-level
|       +--rw lsp-interval?       uint16
|       +--rw passive?            boolean
|       +--rw csnp-interval?      uint16
|       +--rw hello-authentication-type? enumeration
|       +--rw hello-authentication-key? string

```

```

+--rw hello-interval?          uint16
+--rw hello-multiplier?        uint16
+--rw hello-padding?           boolean
+--rw ipv4-unicast?             boolean
+--rw ipv6-unicast?             boolean
+--rw ipv4-multicast?           boolean
+--rw ipv6-multicast?           boolean
+--rw interface-type?           enumeration
+--rw enabled?                  boolean
+--rw tag*                      uint32
+--rw level-1
|   +--rw hello-authentication-type? enumeration
|   +--rw hello-authentication-key?  string
|   +--rw hello-interval?            uint16
|   +--rw hello-multiplier?          uint16
|   +--rw ipv4-unicast?               boolean
|   +--rw ipv6-unicast?               boolean
|   +--rw ipv4-multicast?             boolean
|   +--rw ipv6-multicast?             boolean
|   +--rw priority?                  uint8
|   +--rw ipv4-unicast-metric?        isis-wide-metric
|   +--rw ipv6-unicast-metric?        isis-wide-metric
|   +--rw ipv4-multicast-metric?      isis-wide-metric
|   +--rw ipv6-multicast-metric?      isis-wide-metric
|   +--rw passive?                   boolean
+--rw level-2
|   +--rw hello-authentication-type? enumeration
|   +--rw hello-authentication-key?  string
|   +--rw hello-interval?            uint16
|   +--rw hello-multiplier?          uint16
|   +--rw ipv4-unicast?               boolean
|   +--rw ipv6-unicast?               boolean
|   +--rw ipv4-multicast?             boolean
|   +--rw ipv6-multicast?             boolean
|   +--rw priority?                  uint8
|   +--rw ipv4-unicast-metric?        isis-wide-metric
|   +--rw ipv6-unicast-metric?        isis-wide-metric
|   +--rw ipv4-multicast-metric?      isis-wide-metric
|   +--rw ipv6-multicast-metric?      isis-wide-metric
|   +--rw passive?                   boolean

```

2.5. Operational states

isis-state container provides operational states for ISIS. This container is divided in multiple components :

- o adjacencies : provides state information about current ISIS adjacencies.

- o spf-log : provides information about SPF events on the node.
- o lsp-log : provides information about LSP events on the node (reception of an LSP or modification of local LSP).
- o database : provides details on current LSDB.
- o hostname : provides information about system-id to hostname mappings.

3. RPC operations

The "ietf-isis" module defines two RPC operations :

- o clear-isis-database : reset the content of a particular ISIS database and restart database synchronization with the neighbors.
- o clear-isis-adjacency : restart a particular set of ISIS adjacencies.

rpcs:

```
+---x clear-isis-adjacency
|   +--ro input
|       +--ro routing-instance-name      rt:routing-instance-state-ref
|       +--ro routing-protocol-instance-name  isis-instance-state-ref
|       +--ro isis-level?                 isis-level
|       +--ro interface?                  string
+---x clear-isis-database
    +--ro input
        +--ro routing-instance-name      rt:routing-instance-state-ref
        +--ro routing-protocol-instance-name  isis-instance-state-ref
        +--ro isis-level?                 isis-level
```

4. Notifications

The "ietf-isis" module a new notification "isis-adjacency-updown". This notification is triggered when an ISIS adjacency moves to Up or Down state.

This notification provides details on the affected adjacency and its new state.

notifications:

```
+---n isis-adjacency-updown
  +---ro interface?          string
  +---ro neighbor?           string
  +---ro neighbor-system-id? isis-system-id
  +---ro isis-level?         isis-level
  +---ro state?              enumeration
  +---ro reason?             string
```

5. Interaction with other YANG modules

The "isis-cfg" container augments the "/rt:routing/rt:routing-instance/rt:routing-protocols/routing-protocol" container of the ietf-routing module by defining ISIS specific parameters.

The "isis-state" container augments the "/rt:routing-state/rt:routing-instance/rt:routing-protocols/routing-protocol" container of the ietf-routing module by defining ISIS specific operational states.

Some ISIS specific routes attributes are added to route objects of the ietf-routing module by augmenting "/rt:routing-state/rt:ribs/rt:rib/rt:routes/rt:route" and "/rt:active-route/rt:output/rt:route".

6. Yang module

<CODE BEGINS> file "ietf-isis@2014-06-25.yang"

```
module ietf-isis {
  namespace "urn:ietf:params:xml:ns:yang:ietf-isis";

  prefix isis;

  import ietf-routing {
    prefix "rt";
  }

  import ietf-inet-types {
    prefix inet;
  }

  import ietf-yang-types {
    prefix yang;
  }

  organization
    "IETF ISIS Working Group";
```

revision 2014-06-20 {
  description "
    * isis-op renamed to isis-state.
    * Multiple instances under isis are removed.
    * interface-cfg grouping removed and content
      is directly included in container isis.
    * TLVxx renamed with human-readable name in isis-database.
      TLV reference are putted in description.
    * Reference to core routing module were fixed.
    * Namespace fixed.
    * Add simple-iso-address type.
    * area-id and system-id in isis container are merged to
      nsap-address.
    * Add isis-system-id type.
    * Add isis-lsp-id type.
    * Add remaining-lifetime leaf in isis-database.
    * Add TLV2 (is-neighbor) in isis-database.
    * Renamed some container name for consistency
      reason ('isis-' prefixed).
    * Add new identities isis-cfg and isis-state.
    * Add descriptions.
    * Add notification isis-adjacency-updown.
    * Add RPC clear-isis-adjacency and clear-isis-database.
    ";

<CODE ENDS>
```

7. Security Considerations

Configuration and state data defined in this document are designed to be accessed via the NETCONF protocol [RFC6241].

As ISIS is an IGP protocol (critical piece of the network), ensuring stability and security of the protocol is mandatory for the network service.

Authors recommends to implement NETCONF access control model ([RFC6536]) to restrict access to all or part of the configuration to specific users. Access control to RPCs is also critical as RPC permits to clear protocol datastructures that would definitively impact the network service. This kind of RPC needs only to be used in specific cases by well-known experienced users.

Authors consider that all the configuration is considered as sensitive/vulnerable as well as RPCs. But security teams can decide to open some part of the configuration to less experienced users depending on the internal organization, for example :

- o User FullWrite : would access to the whole data model. This kind of profile may be restricted to few experienced people.

- o User PartialWrite : would only access to configuration part within /isis/interfaces/interface. So this kind of profile is restricted to creation/modification/deletion of interfaces. This profile does not have access to RPC.
- o User Read : would only access to state part /isis-state.

Unauthorized access to configuration or RPC may cause high damages to the network service.

The /isis-state/database may contain authentication information. As presented in the description of the /isis-state/database/level-1/lsp/authentication/authentication-key, the authentication MUST never be presented in plaintext format for security reason. Authors recommends the usage of MD5 to present the authentication-key.

Some authentication-key may also be present in the /isis configuration. When configuring ISIS using the NETCONF protocol, authors recommends the usage of secure transport of NETCONF using SSH ([RFC6242]).
