XChaCha: eXtended-nonce ChaCha and AEAD\_XChaCha20\_Poly1305  
draft-arciszewski-xchacha-00

## Abstract

The eXtended-nonce ChaCha cipher construction (XChaCha) allows for ChaCha-based ciphersuites to accept a 192-bit nonce with similar guarantees to the original construction, except with a much lower probability of nonce misuse occurring. This enables XChaCha constructions to be stateless, while retaining the same security assumptions as ChaCha.

This document defines XChaCha20, which uses HChaCha20 to convert the key and part of the nonce into a subkey, which is in turn used with the remainder of the nonce with ChaCha20 to generate a pseudorandom keystream (e.g. for message encryption).

This document also defines AEAD\_XChaCha20\_Poly1305, a variant of [RFC7539] that utilizes the XChaCha20 construction in place of ChaCha20.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

[1.](#) Introduction

AEAD constructions (Authenticated Encryption with Associated Data) allow for message confidentiality to be assured even in the presence of adaptive chosen-ciphertext attacks, but they're known to be brittle to nonce-misuse conditions [[1](#)].

Several nonce misuse resistant cipher constructions have been proposed over the years, including AES-SIV ([[RFC5297](#)]), AES-GCM-SIV [[2](#)], and several CAESAR candidates [[3](#)].

However, a more straightforward strategy can prevent nonce misuse conditions in environments where a large number of messages are encrypted. Simply use a large enough nonce such that applications can generate them randomly for each message and the probability of a collision remains low.

---

Internet-Draft

September 2018

To this end, we propose a solution that is already implemented in many software projects that extends the nonce of ChaCha20 to 192 bits and uses it to build an AEAD construction.

### [1.1](#). Notation and Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

## [2](#). AEAD\_XChaCha20\_Poly1305

XChaCha20-Poly1305 is a variant of the ChaCha20-Poly1305 AEAD construction as defined in [[RFC7539](#)] that uses a 192-bit nonce instead of a 96-bit nonce.

The algorithm for XChaCha20-Poly1305 is as follows:

1. Calculate a subkey from the first 16 bytes of the nonce and the key, using HChaCha20 ([Section 2.2](#)).
2. Use the subkey and remaining 8 bytes of the nonce (prefixed with 4 NUL bytes) with AEAD\_CHACHA20\_POLY1305 from [[RFC7539](#)] as normal. The definition for XChaCha20 is given in [Section 2.3](#).

XChaCha20-Poly1305 implementations already exist in WireGuard [[4](#)], libsodium [[5](#)], Monocypher [[6](#)], xsecretbox [[7](#)], and in Go's crypto/chacha20poly1305 [[8](#)] library.

Similarly, Google's HPolyC [[9](#)] implements XChaCha12-Poly1305.

### [2.1](#). Motivation for XChaCha20-Poly1305

The nonce used by the original ChaCha20-Poly1305 is too short to safely use with random strings for long-lived keys. XChaCha20-Poly1305 does not have this restriction.

By generating a subkey from a 128-bit nonce and the key, a reuse of only the latter 64 bits of the nonce isn't security-affecting, since the key (and thus, keystream) will be different. Additionally a reuse of only the first 128 bits of the nonce isn't security-affecting, as the nonce derived from the latter 64 bits is different.

Assuming a secure random number generator, random 192-bit nonces should experience a single collision (with probability 50%) after roughly  $2^{96}$  messages (approximately  $7.2998163e+28$ ). A more conservative threshold ( $2^{-32}$  chance of collision) still allows for  $2^{64}$  messages to be sent under a single key.

Therefore, with XChaCha20-Poly1305, users can safely generate a random 192-bit nonce for each message and not worry about nonce-reuse vulnerabilities.

As long as ChaCha20-Poly1305 is a secure AEAD cipher and ChaCha is a secure pseudorandom function (PRF), XChaCha20-Poly1305 is secure.

## [2.2.](#) HChaCha20

\*HChaCha20\* is an intermediary step towards XChaCha20 based on the construction and security proof used to create XSalsa20 [[10](#)], an extended-nonce Salsa20 variant used in NaCl [[11](#)].

HChaCha20 is initialized the same way as the ChaCha cipher, except that HChaCha20 uses a 128-bit nonce and has no counter.

Consider the two figures below, where each non-whitespace character represents one nibble of information about the ChaCha states (all numbers little-endian):

```
cccccccc cccccccc cccccccc cccccccc
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
bbbbbbbb nnnnnnnn nnnnnnnn nnnnnnnn
```

ChaCha20 State: c=constant k=key b=blockcount n=nonce

```
cccccccc cccccccc cccccccc cccccccc
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
```

```
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn
```

HChaCha20 State: c=constant k=key n=nonce

After initialization, proceed through the ChaCha rounds as usual.

Once the 20 ChaCha rounds have been completed, the first 128 bits and last 128 bits of the ChaCha state (both little-endian) are concatenated, and this 256-bit subkey is returned.

### [2.2.1.](#) Test Vector for the HChaCha20 Block Function

- o Key = 00:01:02:03:04:05:06:07:08:09:0a:0b:0c:0d:0e:0f:10:11:12:13:14:15:16:17:18:19:1a:1b:1c:1d:1e:1f. The key is a sequence of octets with no particular structure before we copy it into the HChaCha state.
- o Nonce = (00:00:00:09:00:00:00:4a:00:00:00:00:31:41:59:27)

After setting up the HChaCha state, it looks like this:

```
61707865 3320646e 79622d32 6b206574
03020100 07060504 0b0a0908 0f0e0d0c
13121110 17161514 1b1a1918 1f1e1d1c
09000000 4a000000 00000000 27594131
```

ChaCha state with the key setup.

After running 20 rounds (10 column rounds interleaved with 10 "diagonal rounds"), the HChaCha state looks like this:

```
82413b42 27b27bfe d30e4250 8a877d73
4864a70a f3cd5479 37cd6a84 ad583c7b
8355e377 127ce783 2d6a07e0 e5d06cbc
a0f9e4d5 8a74a853 c12ec413 26d3ecdc
```

HChaCha state after 20 rounds

HChaCha20 will then return only the first and last rows, resulting in the following 256-bit key:

82413b4 227b27bfe d30e4250 8a877d73  
a0f9e4d 58a74a853 c12ec413 26d3ecdc

Resultant HChaCha20 subkey

### [2.3.](#) XChaCha20

XChaCha20 can be constructed from an existing ChaCha20 implementation and HChaCha20. All one needs to do is:

1. Pass the key and the first 16 bytes of the 24-byte nonce to HChaCha20 to obtain the subkey.
2. Use the subkey and remaining 8 byte nonce with ChaCha20 as normal (prefixed by 4 NUL bytes, since [\[RFC7539\]](#) specifies a 12-byte nonce).

XChaCha20 is a stream cipher and offers no integrity guarantees without being combined with a MAC algorithm (e.g. Poly1305).

The same HChaCha20 subkey derivation can also be used in the context of an AEAD\_ChaCha20\_Poly1305 implementation to create AEAD\_XChaCha20\_Poly1305, as described in [Section 2](#).

#### [2.3.1.](#) XChaCha20 Pseudocode

```
xchacha20_encrypt(key, nonce, plaintext):  
    subkey = hchacha20(key, nonce[0:15])  
    return chacha20_encrypt(subkey, nonce[16:23], plaintext)
```
