YANG Model for Diffserv
draft-asechoud-netmod-diffserv-model-03

Abstract

This document describes a YANG model of Differentiated Services for configuration and operations.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 26, 2015.

[1.](#) Introduction

This document defines a YANG [[RFC6020](#)] data model for the configuration, state data of Differentiated Services. Any RPC or notification definition is not part of this document. As many vendors have different object constructs to represent the same data, it has been tried to design this model in a very flexible, extensible and generic way to fit into most of the vendor requirements. The model is based on Differentiated Services (Diffserv) architecture and various references have been made to already available standard architecture documents.

Diffserv is a preferred approach for network service providers to offer services to different customers based on their different kinds of network quality-of-service (QoS) objectives. The traffic streams are differentiated based on Differentiated Services Code Points (DSCP) carried in the IP header of each packet. The DSCP markings are applied by upstream node or by the edge router on entry to the Diffserv network.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

3. Diffserv Model Design

Diffserv architecture [[RFC3289](#)] [[RFC2475](#)] describes network node packet classification function and packet conditioning functions.

The complex classification is done at the edge of network and non-edge network devices conditions appropriately marked aggregate traffic based on per-hop behavior rules. Accordingly, a Multi-Field classifier matches the different fields in a packet and a Behavior Aggregated Classifier matches on DS codepoint field of a packet.

Packets MAY be grouped when a logical set of rules are applied on different packet header fields. Also, packet grouping MAY be done based on different values or range of values of same packet header field. Packet grouping MAY also be done based on presence of some values or range of values of a packet field or absence of such values or ranges. This diffserv model is flexible enough to support such logical grouping of packets.

A classifier entry can be stored as an object and used across different interfaces for either of inbound or outbound traffic. Any modification or deletion of such object will in turn results in such changes to the classifier on the corresponding interfaces. A classifier entry contains one or more packet conditioning functions. A packet conditioning function is typically based on direction of traffic and may drop, mark or delay network packets. A set of such classifier entries with corresponding conditioning functions when arranged in order of priority represents a diffserv policy. A diffserv policy MAY contain one or more classifier entries. Actions are configured as inline as compared of classifier entry which can be

stored as object or configured inline in a diffserv policy. This is mainly because actions generally contain more specific parameters like meter rate, or RED threshold. Any new classifier entry in a policy MAY be inserted before or after any other existing classifier-entry [[RFC6020](#)]. Such policies is stored as an object and used across different network device interfaces.

A meter qualifies if the traffic arrival rate is based on agreed upon rate and variability. A meter is generically modeled as qualifying rate and variability defined as a token bucket. Single rate meter [[RFC2697](#)] can be defined as two such token buckets with first defining the rate and committed burst and excess burst for second

bucket. Similarly, two rates meter [[RFC2698](#)] [[RFC2859](#)] can be defined as two such token buckets with first and second defining the committed rate and committed burst parameters and peak rate and peak burst respectively. Different Vendors can extend it to have other types of meters as well.

Metered traffic to each token bucket MAY either be marked or remarked appropriately of the diffserv codepoint packet field or even MAY be dropped. Classified packets through a classifier entry MAY directly be marked.

Packets can be always dropped if exceed agreed upon rates or it could be queued and then dropped based on any of various algorithms. Queue dropping is based on the threshold configured and can head-drop, tail-drop or dropped based on Active Queue Management algorithm like Random Early Detection (RED). Packets can be scheduled out based on priority with minimum-rate or WFQ with bandwidth sharing. Priority scheduler allow queue to use the entire capacity of the interface unless higher priority traffic is queued to be scheduled. If combination of EF [[RFC3246](#)] and multiple AF [[RFC3260](#)] classes of traffic needs to be scheduled, a combination of priority and WFQ scheduler SHOULD be used. Traffic can be shaped by defining a max rate and burst for a leaky bucket profile.

[4.](#) Diffserv Model

The model have four YANG modules. ietf-diffserv-classifier consists of classifier entries identified by a classifier entry name. Each such entry contains list of filter entries. When no filter entry is

present in a classifier entry, it matches all traffic. Each filter entry represent any of the filter type [\[RFC6991\]](#) of a multi-field classifier which can be logically AND/OR with other filter types in the same classifier-entry. The model is flexible enough to take multiple values of the same filter type.

```
module: ietf-diffserv-classifier
  +--rw classifiers
    +--rw classifier-entry* [classifier-entry-name]
      +--rw classifier-entry-name          string
      +--rw classifier-entry-descr?        string
      +--rw classifier-entry-filter-operation? identityref
      +--rw filter-entry* [filter-type filter-logical-not]
        +--rw filter-type                  identityref
        +--rw filter-logical-not            boolean
        +--rw (filter-param)?
          +--:(dscp)
            | +--rw dscp-cfg* [dscp-min dscp-max]
            |   +--rw dscp-min      inet:dscp
            |   +--rw dscp-max      inet:dscp
          +--:(source-ip-address)
            | +--rw source-ip-address-cfg* [source-ip-addr]
            |   +--rw source-ip-addr      inet:ip-prefix
          +--:(destination-ip-address)
            | +--rw destination-ip-address-cfg*
            |   [destination-ip-addr]
            |   +--rw destination-ip-addr      inet:ip-prefix
          +--:(source-port)
```

```

|   +--rw source-port-cfg*
|       [source-port-min source-port-max]

+--:(destination-port)
|   +--rw destination-port-cfg*
|       [destination-port-min destination-port-max]
|   +--rw destination-port-min    inet:port-number
|   +--rw destination-port-max    inet:port-number
+--:(protocol)
|   +--rw protocol-cfg* [protocol-min protocol-max]
|       +--rw protocol-min    uint8
|       +--rw protocol-max    uint8

```

An ietf-diffserv-policy module contains list of policy objects identified by a policy name which MUST be provided. Each policy object contains list of classifier-entries either configured inline or referred as an object. Each such classifier entry is augmented by set of actions. A policy object MAY contain a child-policy in each classifier-entry. A child policy MAY further classify the traffic and execute actions on classified packets.

+--rw child-policy? leafref {hierarchical-policy-support}?

```

ietf-diffserv-action module contains set of diffserv actions which are augmented to ietf-diffserv-policy module and to ietf-diffserv-target module. Marking sets Diffserv codepoint value in the

classified packet. Color-aware and Color-blind meters can be configured. Action counters are defined as grouping and are currently not augmented to any diffserv module.

ietf-diffserv-target module contains reference of diffserv-policy for either direction of network traffic and is augmented to ietf-interfaces [[RFC7223](#)] module.

```
module: ietf-diffserv-target

[Appendix A.](#) Open Items

The current model represents hierarchical QoS alike with the non-leaf and leaf nodes, in a scheduling hierarchy, without any restrictions of actions, such as AQM, that should not be allowed at non-leaf nodes. This is to be addressed in subsequent revisions.
