Definitions of Managed Objects for SCSI over TCP

1. Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet- Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

2. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP based internets. In particular it defines objects for managing a client using the iSCSI (SCSI over TCP) protocol. It is meant to match the latest version of iSCSI defined in [[ISCSI](#)].

3. Acknowledgments

In addition to the authors, several people contributed to the development of this MIB. Thanks especially to those who took the time to participate in our weekly conference calls to flesh out our requirements, object models, table structures, and attributes: Sudhakar Chellam, John Hufferd (IBM), Kevin Gibbons (Nishan), Chad Gregory (Intel), Jack Harwood (EMC), Hari Mudaliar (Adaptec), Ie Wei Njoo (Agilent), Lawrence Lamers (SAN Valley), Satish Mali (Stonefly Networks), and William Terrell (Troika).

4. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- o An overall architecture, described in [RFC 2571](#) [[RFC2571](#)].
- o Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIV1 and described in STD 16, [RFC 1155](#) [[RFC1155](#)], STD 16, [RFC 1212](#) [[RFC1212](#)] and [RFC 1215](#) [[RFC1215](#)]. The second version, called SMIV2, is described in STD 58, [RFC 2578](#) [[RFC2578](#)], STD 58, [RFC 2579](#) [[RFC2579](#)] and STD 58, [RFC 2580](#) [[RFC2580](#)].
- o Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, [RFC 1157](#) [[RFC1157](#)]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in [RFC 1901](#) [[RFC1901](#)] and [RFC 1906](#) [[RFC1906](#)]. The third version of the message protocol is called SNMPv3 and described in [RFC 1906](#) [[RFC1906](#)], [RFC 2572](#) [[RFC2572](#)] and [RFC 2574](#) [[RFC2574](#)].
- o Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, [RFC 1157](#) [[RFC1157](#)]. A second set of protocol operations and associated PDU formats is described in [RFC 1905](#) [[RFC1905](#)].
- o A set of fundamental applications described in [RFC 2573](#) [[RFC2573](#)] and the view-based access control mechanism described in [RFC 2575](#) [[RFC2575](#)].

A more detailed introduction to the current SNMP Management Framework can be found in [RFC 2570](#) [[RFC2570](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

5. Discussion

This MIB structure is intended to satisfy fault, configuration, and performance management for an iSCSI implementation. It is structured around the well-known iSCSI objects, such as targets, initiators, sessions, connections, and the like.

It is worthwhile to note that this is an iSCSI MIB and such reflects only iSCSI objects (real or virtual). This means that this MIB will not directly deal with real SCSI objects or the SCSI protocol in general. This should be dealt with in a SCSI MIB if such a beast exists. The iSCSI tables that would likely have parallel objects in a SCSI MIB contain a RowPointer, which can be used to point to the corresponding object in a standard or proprietary SCSI MIB, should one exist.

The iSCSI MIB consists of ten objects, each of which is represented by several different tables. This section contains a brief description of the "object" hierarchy and a description of each object, followed by a discussion of the actual SNMP table structure within the objects.

5.1. Overall MIB structure

The top-level object in this structure is the iSCSI instance, which contains all of the other objects.

iscsiInstance

- A distinct iSCSI entity within the managed system.
- Most implementations will have one of these.

iscsiListenPort

- An IP Address and TCP Port pair on which this instance is
- listening for connections to its targets.

```
iscsiSession
-- An active iSCSI session between an initiator and a target.
-- A session may be Inbound (outside initiator to our target)
-- or Outbound (our initiator to an outside target).
iscsiConnection
-- An active TCP connection within an iSCSI session
iscsiLun
-- A logical unit number mapping
-- Usually, one for each LUN that the target has accessed
-- on this section.
iscsiTarget
-- An iSCSI target to which this iSCSI instance is providing
-- access.
iscsiLU
-- A logical unit to which this iSCSI target provides access.
iscsiAccessList
-- A list of initiators that are allowed access to this
-- target.
iscsiInitiator
-- An iSCSI initiator, used by this iSCSI instance to access
-- iSCSI targets.
```

An Instance can contain Initiators, Targets, or both. Multiple ListenPorts may be present; the MIB assumes that any Target may be accessed via any ListenPort, although other access controls not reflected in the MIB might limit this.

While Logical Units and LUNs are SCSI-level entities, they are known to the iSCSI-layer addressing. Appropriate information and statistics at the iSCSI level may be kept for each of these. They do provide the capability to be correlated to a SCSI MIB, should one be created; please see the detailed descriptions of these tables for more information. LUs and LUNs are not identical. An LU is a thing, like a disk or tape drive; a LUN is an address through which it is accessed. Therefore, LUs are "owned" by Targets, and LUNs are owned by Sessions.

5.2. MIB "object" structure

Each iSCSI "object" is comprised of several tables, which will make it easier to navigate the iSCSI MIB from a graphical browser, and to update the iSCSI MIB in the future.

Placing all of the indices, attributes, and statistics for each object in the same table would make the addition of new statistics and attributes appear messy. Since iSCSI is an evolving standard, it is worth having a few extra tables to make this easier. To this end, the attributes and statistics have been placed in separate tables,

which augment the main indexed table for each object. Since there are several categories of statistics that will likely grow, most of the objects contain several statistics tables.

The following structure is used for all objects. Just replace the "*" in the following names with the iSCSI object name in which you are interested. For instance, the Target object would be `iscsiTargetInfo`.

```
iscsi*Info
-- The main structure holding objects of a given type
iscsi*Objects
-- sub-iscsi*Info structures go here
-- Example:  iscsiTargetInfo belongs under iscsiInstanceObjects
-- and iscsiConnectionInfo belongs under iscsiSessionObjects
iscsi*Scalars
-- iscsi*Info scalars go here
iscsi*Table
    iscsi*Entry
        -- iscsi*Table index attributes
iscsi*AttributesTable
    iscsi*AttributesEntry
        -- Augments iscsi*Entry
        -- iscsi*Entry non-statistical attributes
iscsi*StatsTable
    iscsi*StatsEntry
        -- Augments iscsi*Entry
        -- iscsi*Entry generic statistical attributes
        -- Examples: Total requests, responses, data bytes
iscsi*CxnErrorStatsTable
    iscsi*CxnErrorStatsEntry
        -- Augments iscsi*Entry
        -- Connection error statistics
        -- Appropriate for Initiator, Target, Session, ListenPort
        -- Examples: Digest, framing, and connection timeout errors
iscsi*TxCmdStatsTable
    iscsi*TxCmdStatsEntry
        -- Augments iscsi*Entry
        -- Number of each type of iSCSI request PDU transmitted
        -- Appropriate for Initiator, Session
        -- Examples: TxScsiCmdPDUs, TxLoginCmdPDUs
iscsi*RxCmdStatsTable
    iscsi*RxCmdStatsEntry
        -- Augments iscsi*Entry
        -- Number of each type of iSCSI request PDU received
        -- Appropriate for Target, Session
        -- Examples: RxScsiCmdPDUs, RxLoginCmdPDUs
iscsi*TxRspStatsTable
```

```
iscsi*TxBspStatsEntry
  -- Augments iscsi*Entry
  -- Number of each type of iSCSI response PDU transmitted
  -- Appropriate for Target, Session
  -- Examples: TxScsiRspPDUs, TxLoginRspPDUs
iscsi*RxBspStatsTable
  iscsi*RxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI response PDU received
    -- Appropriate for Initiator, Session
    -- Examples: RxScsiRspPDUs, RxLoginRspPDUs
iscsi*TxBspStatsTable
  iscsi*TxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI login status code transmitted
    -- Appropriate for Target, Session, ListenPort
    -- Examples: TxStsAccepts, TxStsForbiddens
iscsi*RxBspStatsTable
  iscsi*RxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI login status code received
    -- Appropriate for Initiator, Session, ListenPort
    -- Examples: RxStsAccepts, RxStsForbiddens
iscsi*TxBspStatsTable
  iscsi*TxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI reject code transmitted
    -- Appropriate for Target, Session
    -- Examples: TxRjtFormats, TxRjtDataSacks
iscsi*RxBspStatsTable
  iscsi*RxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI reject code received
    -- Appropriate for Initiator, Session
    -- Examples: RxRjtFormats, RxRjtDataSacks
iscsi*TxBspStatsTable
  iscsi*TxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI logout reason transmitted
    -- Appropriate for Initiator, Session
    -- Examples: TxLgtSessionCloses, TxLgtCxnRecoveries
iscsi*RxBspStatsTable
  iscsi*RxBspStatsEntry
    -- Augments iscsi*Entry
    -- Number of each type of iSCSI logout reason received
    -- Appropriate for Target, Session
    -- Examples: RxLgtSessionCloses, RxLgtCxnRecoveries
iscsi*TxBspStatsTable
```

```
iscsi*TxAyncStatsEntry
-- Augments iscsi*Entry
-- Number of each type of iSCSI async message transmitted
-- Appropriate for Target, Session
-- Examples: TxAsyTargetResets, TxAsyLogoutRequests
iscsi*RxAyncStatsTable
iscsi*RxAyncStatsEntry
-- Augments iscsi*Entry
-- Number of each type of iSCSI async message received
-- Appropriate for Initiator, Session
-- Examples: RxAsyTargetResets, RxAsyLogoutRequests
```

Not all of the StatsTables appear in each of the objects. For example, TxCmdStats (commands transmitted) is not appropriate for a TargetTable. Other statistics tables may be added as needed.

5.3. iscsiInstance

iscsiInstanceInfo is the primary table of the iSCSI MIB from which all other tables are derived. It contains the iscsiInstanceTable which lists all the known iSCSI instances accessible by the agent.

One could envision that there might be just one instance (or row in this table); however, it exists as a table to allow for multiple virtual instances. For example, many IP routing products now allow multiple virtual routers. The iscsiTable has the same premise.

Also, it is possible that for rack mounted systems, a single SNMP agent may control and monitor multiple boards or "blades" each of which have one or even more instances.

A scalar predecessor of the table called the iscsiInstanceNumber denotes the number of instances or rows in the iscsiInstanceTable. Each row also contains similar "Number" or instance counts for the various rows of the sub-tables that are derived from this table. The term "endpoint" has been used to denote either a target or initiator instance.

Several tables augment the iscsiInstanceTable to provide attributes and statistics.

iscsiInstanceInfo also contains iscsiInstanceObjects, from which all of the other tables are derived.

5.4. iscsiListenPort

iscsiListenPortInfo is contained within iscsiInstanceObjects, and contains the iscsiListenPortTable.

The iscsiListenPortTable lists local sockets on which the iSCSI instance is listening for incoming connections.

The attributes table that augments the iscsiListenPortTable contains the local IP address, TCP (or other protocol) port, and IP protocol (for now, just TCP) on which the socket is listening.

Statistics tables augmenting the iscsiListenPortTable contain counts of each type of login status code sent, as well as connection and digest errors detected.

This table will usually be empty for iSCSI instances that contain only initiators (such as iSCSI host driver implementations).

5.5. iscsiSession

iscsiSessionInfo is contained within iscsiInstanceObjects, and contains the iscsiSessionTable.

The iscsiSessionTable contains a set of rows that list the sessions known to be existing locally for each iSCSI instance.

The session type for each session indicates whether it is an Inbound Session or an Outbound Session. Inbound sessions are from some other initiator to a target within this iSCSI instance; Outbound sessions are from our initiator to a target outside this iSCSI instance.

An inbound session may be correlated with its local target using the TargetWWUI attribute of the session; the InitiatorWWUI indicates the "other end", in some other entity.

Similarly, an outbound session may be associated with its local initiator using the InitiatorWWUI; in this case, the TargetWWUI indicates the other end.

Many attributes may be negotiated when starting an iSCSI session. These attributes are included in the session object.

Some attributes, such as the integrity and authentication schemes, have some standard values which can be extended by vendors to include their own schemes. Enumerated types have been provided for each of these; if a type is "Other", a corresponding UTF8String is used to indicate the name of the scheme in use.

The `iscsiSession` includes many statistics tables, due to the fact that a session can go either direction. Its statistics are basically a superset of those offered by the Target and Initiator objects.

`iscsiSessionInfo` also contains `iscsiSessionObjects`, from which the Connection and Lun tables are derived.

5.6. `iscsiConnectionTable`

`iscsiConnectionInfo` is contained within `iscsiSessionObjects`, and contains the `iscsiConnectionTable`.

The `iscsiConnectionTable` contains a list of active connections within each session. The augmenting attributes table contains the IP addresses and TCP (or other protocol) ports of both the local and remote side of the connection. These may be used to locate other connection-related information and statistics in the TCP MIB [RFC 2012].

No statistics are currently kept for each connection.

5.7. `iscsiLun`

`iscsiLunInfo` is contained within `iscsiSessionObjects`, and contains the `iscsiLunTable`.

The `iscsiLunTable` contains an entry for each known LUN that is being accessed using this session. Note that it may not contain all of the LUNs that could be accessed; the only ones available to iSCSI are the ones that have been addressed specifically by iSCSI commands. Therefore, LUNs that have been discovered via mechanisms such as the SCSI "report LUNs" will not appear in this table until they are specifically addressed by the initiator.

A RowPointer attribute, `iscsiLunTarget`, is provided to correlate this entry with the Target's LU entry. Sessions of type Inbound may give this RowPointer a non-NULL value, pointing to the associated `iscsiLuEntry`. Sessions of type Outbound must set this to NULL.

Statistics tables augmenting `iscsiLunTable` are provided.

5.8. `iscsiTargetTable`

`iscsiTargetInfo` is contained within `iscsiInstanceObjects`, and contains the `iscsiTargetTable`.

The `iscsiTargetTable` contains a list of iSCSI targets which may be accessed through the iSCSI instance.

iscsiTargetTable attributes include the target's World-Wide Unique Identifier (WWUI), alias string, and the number of LUs. Also included is a RowPointer which can be used to locate the associated SCSI target object, should a SCSI MIB be created.

Statistics tables augmenting iscsiTargetTable are provided.

iscsiTargetInfo also contains iscsiTargetObjects, from which the LU and AccessList tables are derived.

5.9. iscsiLUTable

iscsiLUInfo is contained within iscsiTargetObjects, and contains the iscsiLUTable.

The iscsiLUTable contains a list of iSCSI Logical Units that are accessible via the iSCSI target.

The attributes table contains information that really should be reflected in a SCSI MIB, include the Logical Unit's World-Wide Name (not to be confused with a WWUI), inquiry string, serial number, and device ID. These are included only because they are so necessary in identifying LUs from a management console.

Should a SCSI MIB be implemented, the RowPointer iscsiLuScsiAttributes is provided to index into the SCSI MIB's Logical Unit structure. If this pointer is NULL, the SCSI attributes previously mentioned may be used. If the pointer is non-NULL, the SCSI attributes should be left blank, and the management station should use the SCSI MIB to obtain this information instead.

Statistics identical to those found in the iscsiTarget are included at this level as well.

5.10. iscsiAccessList

iscsiAccessListInfo is contained within iscsiTargetObjects, and contains the iscsiAccessListTable.

The iscsiAccessListTable contains an entry for each initiator that is allowed to access the Target under which it appears. If a target allows access to any initiator, an AccessListEntry with the initiator WWUI "iscsi" should be used.

This table does not cover all possible access control schemes that a vendor could implement. If access to an initiator cannot be determined just by its WWUI, an implementation may use the WWUI "iscsi", or may choose to place no entries in this table.

No statistics are provided for access list entries.

5.11. iscsiInitiatorTable

iscsiInitiatorInfo is contained within iscsiInstanceObjects, and contains the iscsiInitiatorTable.

The iscsiInitiatorTable contains a list of iSCSI initiators which are used by this iSCSI instance to access targets. Most implementations will include a single entry in this table, regardless of the number of physical interfaces the initiator may use.

iscsiInitiatorTable attributes include the initiator's World-Wide Unique Identifier (WWUI) and alias string.

Statistics tables augmenting iscsiInitiatorTable are provided.

6. MIB Definitions

```

DESCRIPTION

". "

REVISION "0102280000Z" -- February 28, 2001

DESCRIPTION

"Complete re-write, with the assistance of various
persons in the iSCSI MIB working group."

REVISION "0007280000Z" -- July 28, 2000

DESCRIPTION "Update to re-arrange the tables so that
the initiator table is now an expansion table
for the base iSCSI table.

Added a couple of additional variables, the
targetLunNumber in the target table and the
lunSerialNumber in the lun table.

Also a better definition of the OBJECT-GROUPs. "

7. Security Considerations

This MIB currently contains no read-write, read-create, or RowStatus variables, and cannot be directly used to affect the configuration or operation of an iSCSI entity.

Information gleaned from this MIB could be used to make connections to the iSCSI targets it represents. However, it is the responsibility of the initiators and targets involved to authenticate each other to ensure that an inappropriately advertised or discovered initiator or target does not compromise their security. These issues are discussed in [[ISCSI](#)].
