**Diameter Policy Groups and Sets**  
**draft-bertz-dime-policygroups-03**

Abstract

This document defines optional Diameter attributes for efficient policy provisioning.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 10, 2017.

This document is subject to [BCP 78](#) and the IETF Trust's Legal Provisions Relating to IETF Documents (<http://trustee.ietf.org/license-info>) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

This document may contain material from IETF Documents or IETF Contributions published or made publicly available before November

10, 2008. The person(s) controlling the copyright in some of this material may not have granted the IETF Trust the right to allow modifications of such material outside the IETF Standards Process. Without obtaining an adequate license from the person(s) controlling the copyright in such materials, this document may not be modified outside the IETF Standards Process, and derivative works of it may not be created outside the IETF Standards Process, except to format it for publication as an RFC or to translate it into languages other than English.

## **1. Introduction**

Policy applications often apply common policies to multiple authorized users. Bulk operations are often applied through the use of group naming, e.g. 3GPP's use of Base Name.

This document defines a grouping mechanism to apply common operations to a group of policies and a membership set that can be used to quickly apply one or more Diameter based policies, e.g. Filter-Rule [[RFC5777](#)] to authorized users.

## **2. Requirements Language**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

## **3. Terminology**

**Authorized Users** An Entity that has been authorized to use a service via a Diameter Application.

**Base Name** An organizational structure used to define a domain for multiple Policy Groups or Membership Domains.

**Determination Type** The matching policy applied, e.g. ANDMASK, AND, etc, for Membership Determination.

**Policy Entity** A type that may be assigned to a Policy Group or Membership. This includes but is not limited to Filters [[RFC7155](#)] or Filter-Rules [[RFC5777](#)].

**Membership Determination** The process by which Policy Entities are selected to be applied to an authorized User.

**Membership Domain** A name assigned to a Membership Set.

**Membership Value** A binary set of values where each bit represents a specific membership pattern.

#### 4. Concepts

Policy Groups represent a union of Policy Entities. These entities MUST be of the same type, e.g. Filters [[RFC7155](#)] or Filter-Rules [[RFC5777](#)].

When establishing groups and membership Sets an optional Base Name MAY be used. It identifies the top level grouping. Policy Entity groups MAY be directly named as well. A Policy Entity's name MUST contain zero or 1 separator character '/'. The value before the separator is a Base Name. When no Base Name is provided, i.e. no separator is present. The value of a policy entity is considered to be part of the Base Name "" (empty string) for any matching purposes. Base Name values MUST NOT contain the '/' character.

A Policy Entity can be applied to multiple, distinct sets of authorized Users. These sets can be based upon their state (paid, past due, etc.), customer type (pre-paid, post-paid, etc.) or many other factors. In such cases, a Membership Domain is used.

Membership Domains are named domains (UTF8Strings) with binary values stored in BitStrings to represent where the Policy Entity is used. A Policy Entity MAY appear in multiple Membership Domains.

This mechanism creates a compact bit pattern to be used which notes when a Policy Entity or Policy Group applies to to an Authorized User.

An Authorized User's memberships are assigned by a Policy-Membership. A Policy Entity is assigned membership via a Membership-Assignment. Multiple assignments may be applied to an Authorized User and Policy Entity but they MUST have unique Membership Domain values. It is also RECOMMENDED to avoid numerous Policy-Membership assignments for an Authorized User as it delays computation of the Policy Entities that should be applied to their Service.

Memberships are matched by understanding the relationship between their values which are represented as sets of bits. These relationships are descibed as Match-Types and are specified as set relations, e.g. subset, superset, etc. Figure 1 shows the reference model.

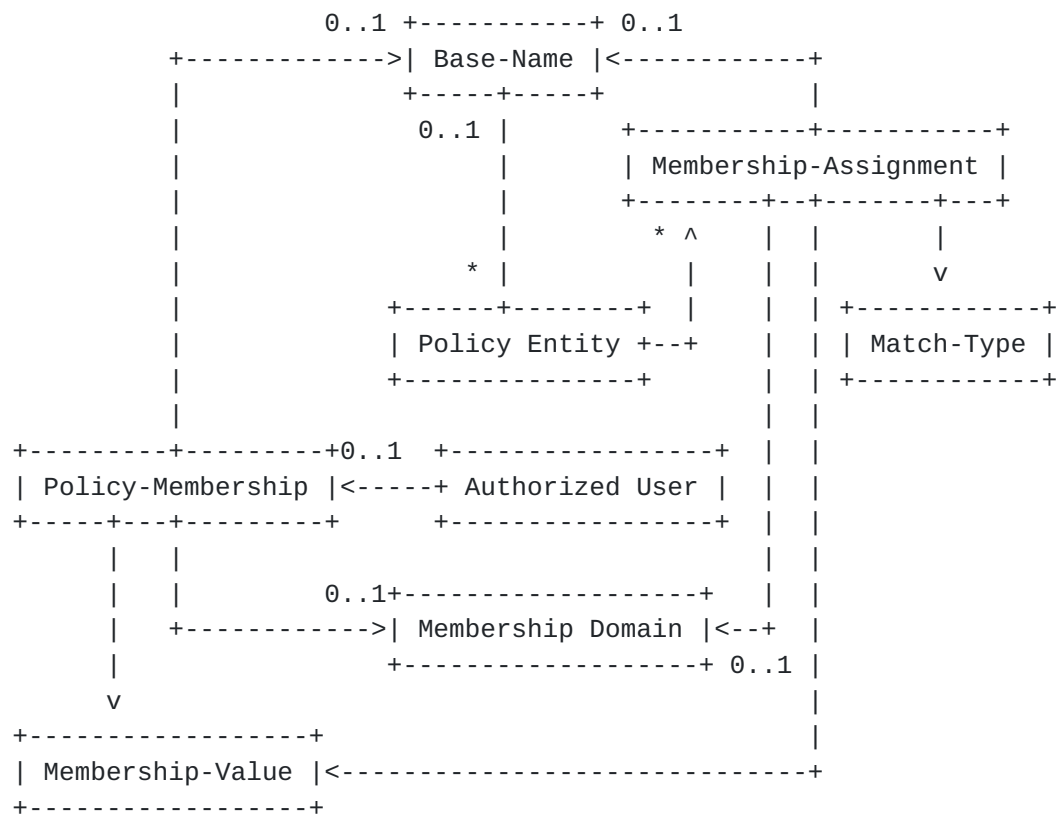

Figure 1: Reference Model

To determine if a Rule is assigned to the User the following conditions MUST be true at least one Membership-Assignments must exist where

Policy-Membership's Membership-Domain = Membership-Assignment's Membership-Domain

Policy-Membership's Membership-Value MUST satisfy the Match-Type for the Membership-Assignments' Membership-Value

## 5. Groups and Membership AVPs

### 5.1. Base-Name AVP

The Base-Name AVP (AVP Code TBD1) is of type UTF8String and defines a group of Policy Entities, e.g. Filters [[RFC7155](#)] or Filter-Rules [[RFC5777](#)].

All Policy Entities with the same Base-Name MUST be of the same AVP type.

A Base-Name MAY be assigned at the creation of the Policy Entity or in a subsequent update but MUST only be assigned once, i.e. re-assignment of the Base-Name MUST NOT be allowed.

### 5.2. Policy-Membership AVP

The Policy-Membership AVP (AVP Code TBD2) is of type Grouped and specifies the Membership-Value and optionally the Membership-Domain and Base-Name for an Authorized User. It is defined as follows (per the grouped-avp-def of [[RFC6733](#)]):

```
Policy-Membership ::= < AVP Header: TBD2 >
    { Membership-Value }
    [ Membership-Domain ]
    [ Base-Name ]
```

Multiple Policy-Membership values MAY be assigned to an Authorized User. However, assigning multiple Policy-Memberships to an Authorized Users MAY delay policy enforcement as membership determination time is increased and SHOULD be avoided.

If multiple Policy-Memberships are assigned to an Authorized User, the Membership-Domain of each Policy-Membership value MUST be unique.

### 5.3. Membership-Assignment AVP

The Membership-Assignment AVP (AVP Code TBD3) is of type Grouped and specifies the Membership-Value and optionally the Membership-Domain and Base-Name for a Policy-Entity. It is defined as follows (per the grouped-avp-def of [[RFC6733](#)]):

```
Membership-Assignment ::= < AVP Header: TBD3 >
    { Membership-Value }
    { Match-Type }
    [ Membership-Domain ]
    [ Base-Name ]
```

Multiple Policy-Membership values MAY be assigned to a Policy Entity. If multiple Policy-Memberships are assigned, the Membership-Domain of each Membership-Assignment MUST be unique.

### 5.4. Membership-Domain AVP

The Membership-Domain AVP (AVP Code TBD4) is of type UTF8String and defines a membership set for a group of Policy Entities, e.g.

Filters [[RFC7155](#)] or Filter-Rules [[RFC5777](#)], that are commonly applied to a set of Authorized Users.

### 5.5. Membership-Value AVP

The Membership-Value AVP (AVP Code TBD5) is of type OctetString and defines a membership of a Policy Entity or Authorized User.

Each bit of the OctetString represents a single position in the Membership-Domain set.

When two Membership-Values of different lengths are compared, the smaller Membership-Value is padded with '0' valued bits until it is the same length as the longer Membership-Value.

### 5.6. Match-Type AVP

The Match-Type AVP (AVP Code TBD6) is of type Enumerated and defines the type of Matching algorithm used for the Policy Entity.

When applying the Match-Type between the Membership-Value of Membership-Assignment (Policy Entity) and a Policy-Membership (Authorized User), the Membership-Domain MUST be the same, i.e. they are omitted or both MUST be present and have the same value.

Match-Types can be one of the following:

EQ 0

The Membership-Values are equal.

SUPER 1

The Membership-Assignment's Membership-Value is a superset of the Policy-Membership's Membership-Value, i.e. they may be equal.

PSUPER 2

The Membership-Assignment's Membership-Value is a proper superset of the Policy-Membership's Membership-Value.

SUB 3

The Membership-Assignment's Membership-Value is a subset of the Policy-Membership's Membership-Value, i.e. they may be equal.

PSUB 4

The Membership-Assignment's Membership-Value is a proper subset of the Policy-Membership's Membership-Value.

#### OVERLAP 5

The Membership-Assignment's Membership-Value has overlap with the Policy-Membership's Membership-Value. They may be equal or have some form of subset / superset relationship.

#### NONOVERLAP 6

The Membership-Assignment's Membership-Value has no intersection with the Policy-Membership's Membership-Value.

## 6. Lifecycle Considerations

Base Names are typically assigned when a Policy Entity is installed on the Diameter Client. Assignment MAY occur after installation but the impact of this is outside of the scope of this document.

Membership-Assignments MAY occur at any time in the lifecycle of the Policy Entity. However, there is no guarantee that resources exist on the Diameter Client to perform a re-evaluation of the membership of all Authorized Users. A Diameter Server MUST NOT assume that re-evaluation will occur or that an evaluation will occur immediately.

Policy-Memberships MAY change at any time in the lifecycle of the Authorized User's session. It is expected that sufficient resources exist to perform a re-evaluation of applicable Policy Entities based upon Membership testing. If this cannot be done a Diameter Application level appropriate message MUST be sent to the Diameter Server.

Generally, Base-Names assignment SHOULD occur upon creation of a Policy Entity or the authorization of a User. Membership-Assignments SHOULD occur prior to an Authorized User being created with a Policy-Membership that would apply the Policy Entity to the Authorized User's session.

## 7. Examples

### 7.1. Rule Sets

A policy administrator has defined three 'default rule sets' based upon various product options selected by a Customer. Each rule set consists of twenty Filter-Rules as defined in [\[RFC5777\]](#).

Rules that are part of Rule Set 1 are given a Membership-Value of 1, Rule Set 2 members are given the value 2 and Rule Set three members have a value of 4 in their respective Membership-Assignment values. All Membership-Assignments have the Membership-Domain of "Product X" and a Match-Type of EQ (Equals).

When a User is Authorized for service usage, a Policy-Membership value is provided with the appropriate Membership-Value set to 1, 2 or 4 and a Membership-Domain of "Product X". The Diameter Client can then appropriately the correct 20 Filter-Rules.

### **7.2. Rule in multiple sets (1 Domain)**

Expanding upon our example from above [Section 7.1](#), a new Filter-Rule is added that is part of both Rule Set 1 and Rule Set 2.

According, the Membership-Assignment has a Membership-Domain of "Product X", a Membership-Value of 3 and a Match-Type of OVERLAP. Thus, any Policy-Membership whose Membership-Value is set to 1 or 2 will have this Filter-Rule applied.

### **7.3. Default Route (Overlapping) Rules**

A common traffic rule is the default (all traffic) rule. It is often used as the lowest priority rule in a policy enforcement session. Even though the rule is typically the same, e.g. "any any", the actions taken may vary, e.g. deny traffic, permit traffic, set quality of service. To distinguish the rules the use of the Membership-Domain in the Membership-Assignment even when the Membership-Value MAY be the same.

## **8. IANA Considerations**

IANA allocated AVP codes in the IANA-controlled namespace registry specified in [Section 11.1.1 of \[RFC6733\]](#) for the following AVPs that are defined in this document.

AVP	AVP Code	Section Defined	Data Type
Base-Name	TBD1	<a href="#">Section 5.1</a>	UTF8String
Policy-Membership	TBD2	<a href="#">Section 5.2</a>	GROUPED
Membership-Assignment	TBD3	<a href="#">Section 5.3</a>	GROUPED
Membership-Domain	TBD4	<a href="#">Section 5.4</a>	UTF8String
Membership-Value	TBD5	<a href="#">Section 5.5</a>	OctetString
Match-Type	TBD6	<a href="#">Section 5.6</a>	Enumerated

## 9. Security Considerations

The use of Base-Names and Membership-Domain can unintentionally provide user information if it is too explicit, e.g. "Bobs' Policies". It is RECOMMENDED that an operator consider the values it assigns and ensure they provide no user or group specific information.

As bit and test patterns the data provided by the Membership-Assignment and Policy-Membership AVPs provide more clues between an Operator and Authorized User's policy relationship. However, it is no different than if one has access to the information transmitted between the Diameter Client and Server today (if the Base-Names and Membership-Domains) follow the recommendations in this section.

In either case, access to the Diameter communications is still required.

The Security Considerations of the Diameter protocol itself have been discussed in [\[RFC6733\]](#). The Diameter base protocol [\[RFC6733\]](#) requires that each Diameter implementation use underlying security; i.e., TLS/TCP, DTLS/SCTP or IPsec. Use of the AVPs defined in this document MUST take into consideration the security issues and requirements of the Diameter base protocol.
