# Biflow implementation support in IPFIX

## Abstract

This document describes how bidirectional flows (biflows) can be implemented in the IP Flow Information Export (IPFIX) protocol. We propose a variety of methods for biflow export, including an extension to the IPFIX Information Model that allows the specification of biflow semantics and a set of counters needed for biflow processing.

## [1. Introduction](#)

Many flow analysis tasks benefit from easy association of the upstream and downstream flows of a bidirectional communication, e.g., separating answered and unanswered TCP requests, calculating round trip times, etc. Metering processes that are not part of an asymmetric routing infrastructure are well positioned to observe bidirectional flows, and IPFIX is very nearly complete as a solution for exporting biflow data.

We propose several methods to export biflow information using IPFIX. Two of these methods do not require any changes to the IPFIX information model, at the expense of export and collection efficiency. The final method requires an extension to the IPFIX

Information Model to include some biflow-related Information Elements (IEs).

## **2. Terminology**

Uniflow (unidirectional flow)

A uniflow is a set of IP packets passing an Observation Point in the network during a certain time interval. All packets belonging to a particular Uniflow have a set of common properties. Each property is defined as the result of applying a function to the values of:

1. One or more packet header fields, transport header fields, or application header fields.

## Biflow implementation support in IPFIX

2. One or more characteristics of the packet itself.
3. One or more fields derived from packet treatment.

A packet is said to belong to a Uniflow if it completely satisfies all the defined properties of the Uniflow.

This definition is simply the IPFIX definition of an IP Flow [[IPFIX-PROTO](#)].

### Biflow (bidirectional flow)

A biflow is the product of matching the two uniflow sides of a bidirectional communication session (e.g., TCP session, UDP DNS question and answer) into a single entity. The semantics of "source" and "destination" information elements within the context of a given biflow are variable; since "source" and "destination" are not derived directly from their respective packet header fields, the IPFIX definition of IP Flow alone is not sufficient to describe biflows.

## **3. Biflow Implementation Strategies**

This section introduces the problems associated with representing biflows in IPFIX, and presents a variety of strategies for implementing biflow support.

### **3.1 Biflow Semantics**

When handling uniflows, the semantics of "source" and "destination" information elements are clearly defined by the semantics of the underlying packet header data. When grouping biflows into single IPFIX data records, the definitions of "source" and "destination" become less clear.

The most basic method for classifying the two addresses in a biflow is to define the source address of the flow as the source address of the first packet seen in that flow by the metering process. Some metering technologies may attempt to improve upon this method using some knowledge of the transport or application protocols (e.g., TCP flags, DNS question/answer counts) in order to define the source address of the flow as the connection or transaction initiator. In either case, the design is the same: one of the underlying uniflows is assumed to be in the "forward" direction, and one in the "reverse" direction; the "forward" uniflow is selected based upon some characteristic of the connection itself.

Another way to classify biflow addresses is by perimeter; in this method, a metering process discriminates between "inside" and "outside" the network, and defines the source address as the address on one side of this perimeter (generally the "outside" address; defining source loosely as "attacker"). Perimeter biflows may require additional information elements to identify the flow initiator, if such functionality is supported by the metering process. This revision of this draft does not address perimeter biflows further.

These two are by no means an exhaustive list of biflow semantics. However, IPFIX should aim to provide better support for the simpler, more common semantics in preference to more exotic schemes.

### 3.2 Two-Record Flow Association using flowId IE

The simplest way to implement biflow support using IPFIX is to sidestep the single-record unification entirely, and annotate two uniflow records as being part of the same biflow by using the existing flowId information element. If an exporting process supports biflow export via this method, it is recommended that it export the two flow data records comprising the biflow appear sequentially, within the same data set, in order of start time. This ensures that the collecting process does not need to cache more than a single flow to support biflow reassembly on its end.

This method has the advantage of simplicity and minimal impact on the protocol. However, as two uniflows in a single biflow share all flow key data, it is not the most efficient method for transporting biflow data.

#### 3.2.1 Example

Both data records representing each biflow are described by the same template, which follows the pattern below:

```

+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|           Set ID = 2           |           Length = 12 + 4m + 4n           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|           Template ID >= 256   |           Field Count = 1 + m + n           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|0|           FlowId = 148        |           Field Length = 4           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|0|           Flow Key IE 1        |           Field Length (Key 1)           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
. . .
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|0|           Flow Key IE n        |           Field Length (Key n)           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|0|           Flow Value IE 1      |           Field Length (Value 1)           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
. . .
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|0|           Flow Value IE m      |           Field Length (Value m)           |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

The fields have been simply distinguished by FlowID (that identifies the two uniflows as part of the same biflow), flow key fields and flow value IEs to be exported.

### 3.3 Multiple Record Flow Aggregation using flowId IE

The main shortcoming of the previous method is the replication of information exported, since two uniflows in a biflow share all flow key data. This second method aggregates the flow fields common to both uniflows sending them in an Option record with FlowID as scope. The FlowID IE represents the identifier of the biflow. The two uniflow records part of the same biflow export the flow information (but not the flow key fields), the flowID and the source or the directionDomain IE (see [section 3.4.1.15](#)) to identify the two uniflows.

Using the source doesn't require any extension to the Information Model, but exporting three records per biflow and using an IP address (especially an IPv6 address) to identify

## Biflow implementation support in IPFIX

If an exporting process supports biflow export via this method, it MUST ensure that the option record is sent first. The exporter sends the flow key fields just once and subsequently refers to them using the flowID. This method makes sense when the records are exported at regular intervals but doesn't introduce an improvement if the data is exported just at the end of the flow.

### 3.3.1 Example

The flow keys are exported in an options data record described by a template following the pattern below:

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Set ID = 3           |           Length = 14 + 4n (+2)           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Template ID >= 256   |           Field Count = 1 + n           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Scope Field Count = 1 |0|           FlowID = 148           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Scope Field Length = 4 |0|           Flow Key IE 1           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Field Length (Key 1)  |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|                                     . . .
|                                     +-----+-----+-----+-----+-----+
|                                     |0|           Flow Key IE n           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Field Length (Key n)  |           Padding (optional) = 0           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Each of the flow value data records is defined by a template following the pattern below:

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Set ID = 2           |           Length = 16 + 4m           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Template ID > 256    |           Field Count = 2 + m           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           FlowId = 148       |           Field Length = 4           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           sourceIPv4Address = 8 |           Field Length = 4           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Flow Value IE 1     |           Field Length (Value 1)     |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|                                     . . .
```

```

+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|0|      Flow Value IE m          |      Field Length (Value m)      |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

```

### **3.4 Single Record biflows using directionDomain IE**

Biflows can be represented in IPFIX using a single data record per flow by extending the IPFIX information model. First, a set of "reverse" counters are defined to count packets sent by the biflow destination, and the current "forward" counters are defined to count packets send by the biflow source. Second, an additional information element, directionDomain, is defined to specify the semantics of biflow source and destination.

The reverse counter information elements MUST be semantically defined by a directionDomain information element. The

## Biflow implementation support in IPFIX

directionDomain IE can appear in the biflow record itself, or be scoped to the sourceId or templateId associated with the biflow record.

Note that no reverse post-multicast counters are defined, because multicast flows are inherently unidirectional.

### [3.4.1](#) **New Information Elements for Single Record biflows**

The following information elements are required to support single record biflows:

#### [3.4.1.1](#) **reverseOctetDeltaCount**

Description:

The number of octets since the previous report (if any) in packets sent by the biflow destination for this biflow.

The number of octets includes IP header(s) and IP payload.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 216

Status: proposed

Units: octets

#### [3.4.1.2](#) **reversePostOctetDeltaCount**

Description:

The definition of this Information Element is identical to the definition of Information Element

'reverseOctetDeltaCount',

except that it reports a potentially modified value caused by a middlebox function after the packet passed the observation point.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 217

Status: proposed

Units: octets

#### [3.4.1.3](#) **reverseOctetDeltaSumOfSquares**

Description:

The sum of the squared numbers of octets since the previous report (if any) in packets sent by the biflow destination for this biflow. The number of octets include IP header(s) and IP payload.

Abstract Data Type: unsigned64

ElementId: 218  
Status: proposed  
Units: octets

#### **3.4.1.4 reverseOctetTotalCount**

Description:

The total number of octets in packets sent by the biflow destination since the Metering Process (re-)initialization for this Observation Point. The number of octets includes IP header(s) and IP payload.

Abstract Data Type: unsigned64  
Data Type Semantics: totalCounter  
ElementId: 219  
Status: proposed

## Biflow implementation support in IPFIX

Units: octets

### [3.4.1.5](#) **reversePostOctetTotalCount**

Description:

The definition of this Information Element is identical to the definition of Information Element 'reverseOctetTotalCount', except that it reports a potentially modified value caused by a middlebox function after the packet passed the observation point.

Abstract Data Type: unsigned64

Data Type Semantics: totalCounter

ElementId: 220

Status: proposed

Units: octets

### [3.4.1.6](#) **reverseOctetTotalSumOfSquares**

Description:

The total sum of the squared numbers of octets in packets sent by the biflow destination for this biflow since the Metering Process (re-)initialization for this Observation Point. The number of octets include IP header(s) and IP payload.

Abstract Data Type: unsigned64

ElementId: 221

Status: proposed

Units: octets

### [3.4.1.7](#) **reversePacketDeltaCount**

Description:

The number of packets since the previous report (if any) for this biflow sent by the biflow destination.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 222

Status: proposed

Units: packets

### [3.4.1.8](#) **reversePostPacketDeltaCount**

Description:

The definition of this Information Element is identical to the definition of Information Element 'reversePacketDeltaCount', except that it reports a potentially modified value caused by a middlebox function after the packet passed the observation point.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 223  
Status: proposed  
Units: packets

#### **3.4.1.9 reversePacketTotalCount**

Description:

The total number of packets sent by the biflow destination for this biflow at the since the Metering Process (re-) initialization for this Observation Point.

Abstract Data Type: unsigned64

Data Type Semantics: totalCounter

ElementId: 224

Status: proposed

Units: packets

## Biflow implementation support in IPFIX

### [3.4.1.10](#) **reversePostPacketTotalCount**

Description:

The definition of this Information Element is identical to the definition of Information Element 'reversePacketTotalCount', except that it reports a potentially modified value caused by a middlebox function after the packet passed the observation point.

Abstract Data Type: unsigned64

Data Type Semantics: totalCounter

ElementId: 225

Status: proposed

Units: packets

### [3.4.1.11](#) **reverseDroppedOctetDeltaCount**

Description:

The number of octets since the previous report (if any) in packets sent by the biflow destination for this biflow dropped by packet treatment. The number of octets include IP header(s) and IP payload.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 226

Status: proposed

Units: octets

### [3.4.1.12](#) **reverseDroppedPacketDeltaCount**

Description:

The number of packets since the previous report (if any) sent by the biflow destination for this biflow dropped by packet treatment.

Abstract Data Type: unsigned64

Data Type Semantics: deltaCounter

ElementId: 227

Status: proposed

Units: packets

### [3.4.1.13](#) **reverseDroppedOctetTotalCount**

Description:

The total number of octets in packets sent by the biflow destination for this biflow dropped by packet treatment since the Metering Process (re-)initialization for this Observation Point. The number of octets include IP header(s) and IP payload.

Abstract Data Type: unsigned64

Data Type Semantics: totalCounter  
ElementId: 228  
Status: proposed  
Units: octets

#### **3.4.1.14 reverseDroppedPacketTotalCount**

Description:

The total number of packets sent by the biflow destination for this biflow dropped by packet treatment since the Metering Process (re-)initialization for this Observation Point.

Abstract Data Type: unsigned64  
Data Type Semantics: totalCounter  
ElementId: 229  
Status: proposed  
Units: packets

## Biflow implementation support in IPFIX

### 3.4.1.15 directionDomain

#### Description:

Defines the semantics of source and destination information elements, and of reverse counters. This information element is intended to be bound to a sourceID or a templateID in an options data record. Defined values include:

0x00: Uniflow. Source and destination are defined as in the packet headers from which the flows were generated. Reverse counters have no defined meaning. This directionDomain is not appropriate for exporting biflows in single data records. This is the present default IPFIX behavior.

0x01: First Packet Biflow. The source of the biflow is defined as the source of the first packet seen within the flow by the Metering Process, and the destination of the biflow is defined as the destination of that first packet. Counters count packets sent by the first packet source, and reverse counters count packets sent by the first packet destination.

0x02: Initiator Biflow. The source of the biflow is defined as the source of the packet initiating the connection as determined by the Metering Process, and the destination of the biflow is defined as the destination of the packet initiating the connection. This is similar to First Packet Biflow, except it gives the Metering Process some latitude to attempt to determine the connection initiator when the initiator is not necessarily the sender of the first packet seen by the Metering Process.

0x03: Listener Biflow. The destination of the biflow is defined as the source of the packet initiating the connection as determined by the Metering Process or the Exporting Process, and the source of the biflow is defined as the destination of the packet initiating the connection. This is similar to Initiator Biflow, except the source and destination are reversed. This is primarily useful for the case when the directionDomain information element is present in each flow data record, and an intermediate process handling multiple Metering Processes determines an Initiator biflow should be reversed.

0x03 - 0x7F: Reserved for future assignment

0x80 - 0xFF: Reserved for private or experimental use.

Abstract Data Type: octet

Data Type Semantics: identifier  
ElementId: 215  
Status: proposed

[Page 9]

## Biflow implementation support in IPFIX

### 3.4.2 Example

Each single biflow data record can be described by a template following the pattern below.

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Set ID = 2           | Length = 8 + 4k + 4m + 4n |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Template ID >= 256    | Field Count = k + m + n |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Flow Key IE 1        | Field Length (Key 1)    |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
                                     . . .
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Flow Key IE n        | Field Length (Key n)    |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Flow Value IE 1      | Field Length (Value 1)  |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
                                     . . .
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Flow Value IE m      | Field Length (Value m)  |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0| Reverse Value IE 1 (216-229)| Field Length (Reverse 1)|
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
                                     . . .
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|0|           Reverse Value IE k   | Field Length (Reverse k)|
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

The options template below describes an options record that MUST be present to semantically define the reverse counter information. The directionDomain could also be associated with a sourceID, or for the cost of one octet per record, appear in the biflow record itself.

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Set ID = 3           |           Length = 18 (+2)           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Template ID >= 256    |           Field Count = 2           |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Scope Field Count = 1 |0|           templateId = 148         |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Scope Field Length = 2 |0|           directionDomain = 215     |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
|           Field Length = 1      |           Padding (optional)        |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

#### **4. IANA Considerations**

This document defines a set of new IPFIX Information Elements that extend those already defined in [[IPFIX-INFO](#)].

As specified in [[IPFIX-INFO](#)] IANA needs to create a new registry for IPFIX Information Element identifiers. New assignments for IPFIX Information Elements will be administered by IANA, on a First Come First Served basis [[RFC2434](#)], subject to Expert Review [[RFC2434](#)], i.e. review by one of a group of expert designated by an IETF Operations and Management Area Director. The group of experts must double check the Information Elements definitions with already defined Information Elements for completeness, accuracy, redundancy, and correct naming following the naming conventions in [[IPFIX-INFO](#)]. Those experts will initially be drawn from the Working Group Chairs and document editors of the IPFIX and PSAMP Working Groups [[IPFIX-INFO](#)].

## Biflow implementation support in IPFIX

### **5. Security Considerations**

The same security considerations as for the IPFIX protocol [[IPFIX-PROTO](#)] apply.

## **9. Intellectual Property Statement**

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in [BCP 78](#) and [BCP 79](#).

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at [ietf-ipr@ietf.org](mailto:ietf-ipr@ietf.org).

## **10. Copyright Statement**

Copyright (C) The Internet Society (2005). This document is subject to the rights, licenses and restrictions contained in [BCP 78](#), and except as set forth therein, the authors retain all their rights.

## **11. Disclaimer**

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.
