YANG Data Models for the Port Control Protocol (PCP)
draft-boucadair-pcp-yang-02

Abstract

This document defines YANG data models for the Port Control Protocol (PCP).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 2, 2016.

[1. Introduction](#)

This document defines a data model for the Port Control Protocol (PCP, [[RFC6887](#)]) using the YANG data modeling language [[RFC6020](#)]. The following functional elements are in scope:

- o PCP client [[RFC6887](#)].
- o PCP server [[RFC6887](#)].
- o PCP proxy [[RFC7648](#)].
- o Universal Plug and Play (UPnP) Internet Gateway Device - Port Control Protocol Interworking Function (UPnP IGD-PCP IWF) [[RFC6970](#)].

In addition to the base features defined in [[RFC6887](#)], this document covers the following capabilities:

Boucadair, et al.

Expires December 2, 2016

[Page 2]

- o PCP Description option [[RFC7220](#)].
- o PCP Prefix64 option [[RFC7225](#)].
- o Port set allocation [[RFC7753](#)].

In conformance with [[RFC7291](#)] and [[RFC7488](#)], this document assumes that multiple PCP servers may be configured to a PCP client, PCP proxy or UPnP IGD-PCP IWF; each server is defined by a list of IP addresses.

This document follows the guidelines of [[RFC6087](#)].

This document uses the common YANG types defined in [[RFC6991](#)].

This version does not allow to manage advanced PCP authentication features [[RFC7652](#)].

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

This document makes use of the terms defined in [[RFC6887](#)], [[RFC7648](#)], [[RFC6970](#)], and [[RFC6970](#)].

The terminology for describing YANG data models is defined in [[RFC6020](#)].

1.2. Tree Diagrams

The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Curly braces "{" and "}" contain names of optional features that make the corresponding node conditional.
- o Abbreviations before data node names: "rw" means configuration (read-write), "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" a container with presence, and "*" denotes a "list" or "leaf-list".
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon ":").

- o Ellipsis ("...") stands for contents of subtrees that are not shown.

1.3. IP Address Format

Following the rationale defined in [Section 5 of \[RFC6887\]](#), this document uses IPv4-mapped IPv6 addresses to encode IPv4 addresses.

The all-zeros IPv6 address are expressed as (::).

The all-zeros IPv4 address is expressed by 80 bits of zeros, 16 bits of ones, and 32 bits of zeros (::ffff:0:0).

2. Overview of the PCP Data Models

The following sub-sections provide an overview of the PCP data models.

2.1. Common PCP

Common PCP YANG data model groups a set of common definitions that are used in all PCP modules.

2.2. PCP Client

Figure 1 depicts the YANG data model for the PCP client:

```
module: ietf-pcp-client
  +-rw pcp-client-config
    |  +-rw enable?          boolean
    |  +-rw description?    string
    |  +-rw pcp-client-instances
    |    +-rw pcp-client-instance* [id]
    |      +-rw id           uint32
    |      +-rw name?         string
    |      +-rw version* [version]
    |        +-rw version     uint8
    |      +-rw pcp-servers* [pcp-server-id]
    |        +-rw pcp-server-id   uint32
    |        +-rw pcp-server-ip-address* [address-id]
    |          +-rw address-id   uint32
    |          +-rw ip-address    inet:ipv6-address
    |          +-rw external-address-familly  inet:ip-version
    |          +-rw stale-external-ip-address?  inet:ipv6-prefix
    +-rw authentication-enable?  boolean
    +-rw opcode-configuration
      +-rw map?            boolean
      +-rw peer?           boolean
```

description
"The subscriber-mask is an integer that indicates
the length of significant bits to be applied on
the source IPv6 address (internal side) to
identify unambiguously a CPE.

Subscriber-mask is a system-wide configuration
parameter that is used to enforce generic per-subscriber
policies (e.g., port-quota).

Applying these generic policies does not require
configuring every subscriber's prefix.

Example: suppose the 2001:db8:100:100::/56 prefix is
assigned to a DS-Lite enabled CPE. Suppose also that the
2001:db8:100:100::1 is the IPv6 address used by the
client that resides in that CPE. When the server
receives a packet from this client,
the server applies the subscriber-mask (e.g., 56) on
the source IPv6 address to compute the associated prefix
for this client (that is 2001:db8:100:100::/56). Then,
the server enforces policies based on that prefix
(2001:db8:100:100::/56), not on the exact
source IPv6 address.";

container lifetime {
    description
        "Configure values for the lifetime to be
         assigned to requesting PCP clients.
```

The client requests a certain lifetime, and the server responds with the assigned lifetime.

The server may grant a lifetime smaller or larger than the requested lifetime.

The minimum value should be 120 seconds.

The maximum value should be the remaining lifetime of the IP address assigned to the PCP client if that information is available, or half the lifetime of IP address assignments, or 24 hours.

Excessively long lifetimes can cause consumption of ports even if the internal host is no longer interested in receiving the traffic or is no longer connected to the network.

([Section 15 \[RFC6877\]](#).)

4. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the support of SSH is mandatory to implement secure transport [[RFC6242](#)]. The NETCONF access control

model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and contents.

There is a number of data nodes defined in the YANG module which can, be created, modified and deleted (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) applied to these data nodes without proper protection can negatively affect network operations. In particular, configuring a fake PCP server may be used to redirect the traffic from a PCP client to an illegitimate server.

5. IANA Considerations

This document requests IANA to register the following URIs in the "IETF XML Registry" [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-pcp
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-client
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-iwf
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-proxy
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-server
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

This document requests IANA to register the following YANG modules in the "YANG Module Names" registry [[RFC6020](#)].

```
name: ietf-pcp
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp
prefix: pcp
reference: RFC XXXX

name: ietf-pcp-client
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-client
prefix: pcp-client
reference: RFC XXXX

name: ietf-pcp-iwf
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-iwf
prefix: pcp-iwf
reference: RFC XXXX

name: ietf-pcp-proxy
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-proxy
prefix: pcp-proxy
reference: RFC XXXX

name: ietf-pcp-server
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-server
prefix: pcp-server
reference: RFC XXXX
```
