YANG Modules for the Port Control Protocol (PCP)
draft-boucadair-pcp-yang-05

Abstract

This document defines YANG modules for the Port Control Protocol (PCP), including PCP client, PCP server, PCP proxy, and Universal Plug and Play (UPnP) Internet Gateway Device - Port Control Protocol Interworking Function.

Editorial Note (To be removed by RFC Editor)

Please update this statement with the RFC number to be assigned to this document:

"This version of this YANG module is part of RFC XXXX;"

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 19, 2018.

[1.](#) Introduction

This document defines a data model for the Port Control Protocol

(PCP, [[RFC6887](#)]) using the YANG data modeling language [[RFC7950](#)]. The following functional elements are in scope:

- o PCP client [[RFC6887](#)].

- o PCP server [[RFC6887](#)].
- o PCP proxy [[RFC7648](#)].
- o Universal Plug and Play (UPnP) Internet Gateway Device - Port Control Protocol Interworking Function (UPnP IGD-PCP IWF) [[RFC6970](#)].

In addition to the base features defined in [[RFC6887](#)], this document covers the following capabilities:

- o PCP Description option [[RFC7220](#)].
- o PCP Prefix64 discovery option [[RFC7225](#)].
- o PCP Port set allocation [[RFC7753](#)].

In conformance with [[RFC7291](#)] and [[RFC7488](#)], this document assumes that multiple PCP servers may be configured to a PCP client, PCP proxy, or UPnP IGD-PCP IWF; each server is defined by a list of IP addresses.

This document follows the guidelines of [[RFC6087](#)].

This document uses the common YANG types defined in [[RFC6991](#)].

This document does not allow to manage advanced PCP authentication features [[RFC7652](#)].

[1.1](#). Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

This document makes use of the terms defined in [[RFC6887](#)], [[RFC7648](#)],

[\[RFC6970\]](#), and [\[RFC6970\]](#).

The terminology for describing YANG modules is defined in [\[RFC7950\]](#).

[1.2.](#) Tree Diagrams

The meaning of the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Curly braces "{" and "}" contain names of optional features that make the corresponding node conditional.

- o Abbreviations before data node names: "rw" means configuration (read-write), "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" a container with presence, and "*" denotes a "list" or "leaf-list".
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

[1.3.](#) IP Address Format

Following the rationale defined in [Section 5 of \[RFC6887\]](#), this document uses IPv4-mapped IPv6 addresses to encode IPv4 addresses.

The all-zeros IPv6 address are expressed as (::).

The all-zeros IPv4 address is expressed by 80 bits of zeros, 16 bits of ones, and 32 bits of zeros (::ffff:0:0).

[2.](#) Overview of the PCP YANG Modules

The following sub-sections provide an overview of the PCP data models.

[2.1.](#) Common PCP

Common PCP YANG module groups a set of common definitions that are used in all PCP YANG modules.

[2.2.](#) PCP Client

Figure 1 depicts the YANG module for the PCP client.

```
module: ietf-pcp-client
  +--rw pcp-client
    +--rw enable?          boolean

        the length of significant bits to be applied on
        the source IPv6 address (internal side) to
        identify unambiguously a CPE.

        Subscriber-mask is a system-wide configuration

```

parameter that is used to enforce generic per-subscriber policies (e.g., port-quota).

Applying these generic policies does not require configuring every subscriber's prefix.

Example: suppose the 2001:db8:100:100::/56 prefix is assigned to a DS-Lite enabled CPE. Suppose also that the 2001:db8:100:100::1 is the IPv6 address used by the client that resides in that CPE. When the server receives a packet from this client, the server applies the subscriber-mask (e.g., 56) on the source IPv6 address to compute the associated prefix for this client (that is 2001:db8:100:100::/56). Then, the server enforces policies based on that prefix

```
(2001:db8:100:100::/56), not on the exact
source IPv6 address.";

<CODE ENDS>

4. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the support of SSH is mandatory to implement secure transport [[RFC6242](#)]. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and contents.

There is a number of data nodes defined in the YANG module which can, be created, modified and deleted (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) applied to these data nodes without proper protection can negatively affect network operations. In particular, configuring a fake PCP server may be used to redirect the traffic from a PCP client to an illegitimate server.

5. IANA Considerations

This document requests IANA to register the following URIs in the "IETF XML Registry" [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-pcp
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-client
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-iwf
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-proxy
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-pcp-server
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

This document requests IANA to register the following YANG modules in the "YANG Module Names" registry [[RFC7950](#)].

name: ietf-pcp
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp
prefix: pcp
reference: RFC XXXX

name: ietf-pcp-client
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-client
prefix: pcp-client
reference: RFC XXXX

name: ietf-pcp-iwf
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-iwf
prefix: pcp-iwf
reference: RFC XXXX

name: ietf-pcp-proxy
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-proxy
prefix: pcp-proxy
reference: RFC XXXX

name: ietf-pcp-server
namespace: urn:ietf:params:xml:ns:yang:ietf-pcp-server
prefix: pcp-server
reference: RFC XXXX
