## **The Session Initiation Protocol Conference Bridge Transcoding Model**

### STATUS OF THIS MEMO

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress".

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

To view the list Internet-Draft Shadow Directories, see <http://www.ietf.org/shadow.html>.

### Abstract

This document describes how to invoke transcoding services using the conference bridge model. This way of invocation meets the requirements for SIP regarding transcoding services invocation to support deaf, hard of hearing and speech-impaired individuals.

## **1 Introduction**

The framework for transcoding with SIP [[1](#)] ([draft-ietf-sipping-transc-framework](#)) describes how two SIP UAs can discover incompatibilities that prevent them from establishing a session (e.g., lack of support for a common codec or for a common media type). When such incompatibilities are found, the UAs need to invoke transcoding services to successfully establish the session. Using the conference bridge model is one way to perform such invocation.

In the conference bridge model for transcoding invocation, a transcoding server that provides a particular transcoding service (e.g., speech-to-text) behaves as a B2BUA between both UAs and is identified by a URI.

## **2 Caller's Invocation**

Figure 1 shows the message flow for the caller's invocation of a transcoder T. The caller (A) sends an INVITE (1) to the transcoder (T) to establish the session A-T. The URI in the Request-URI of this INVITE contains a list parameter, as defined in [[2](#)] ([draft-camarillo-sipping-uri-list-01](#)), with a pointer to a URI list. This URI list contains a single URI: the callee's URI, as shown below:

```
INVITE sip:transcoder@example.com;list=cid:cn35t8@example.com SIP/2.0
Via: SIP/2.0/TCP client.chicago.example.com

```

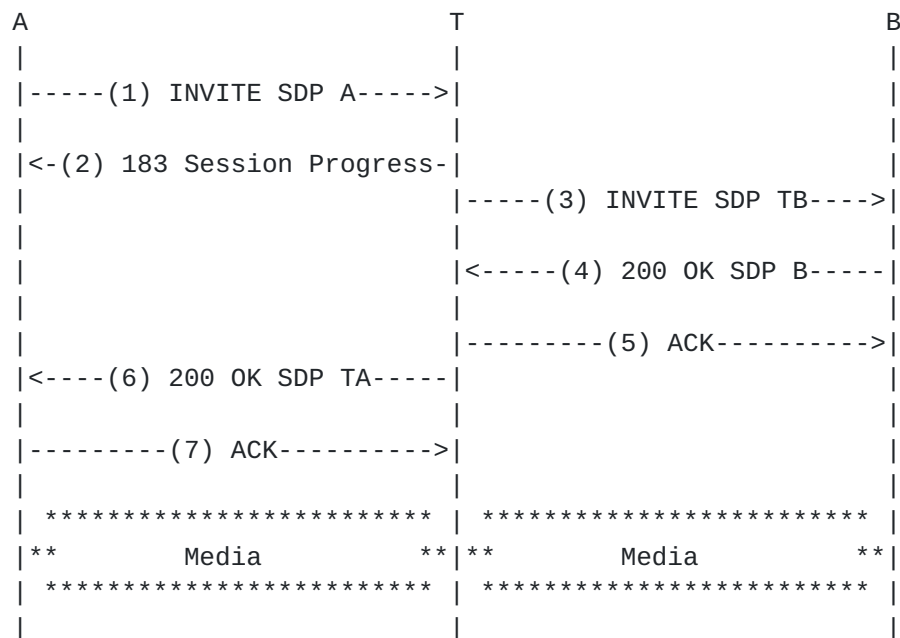

Figure 1: Successful invocation of a transcoder by the caller

On reception of the INVITE, the transcoder generates a new INVITE towards the callee. The transcoder acts as a B2BUA, so, this new INVITE (3) belongs to a different transaction than the INVITE (1) received by the transcoder.

When the transcoder receives a final response (4) from the callee, it

generates a new final response (6) for INVITE (1). This new final response (6) has the same status code as the one received in the response from the callee (4).

The advantage of this message flow is that, for both user agents, is identical to the flow for establishing a regular session (i.e., without transcoder) between them. Additionally, the only difference in the message contents is that the caller needs to use a list parameter in the Request-URI of the initial INVITE.

## 2.1 Unsuccessful Session Establishment

Figure 2 shows a similar message flow as the one in Figure 1. Nevertheless, this time the callee generates a non-2xx final response (4). Consequently, the transcoder generates a non-2xx final response (6) towards the caller as well.

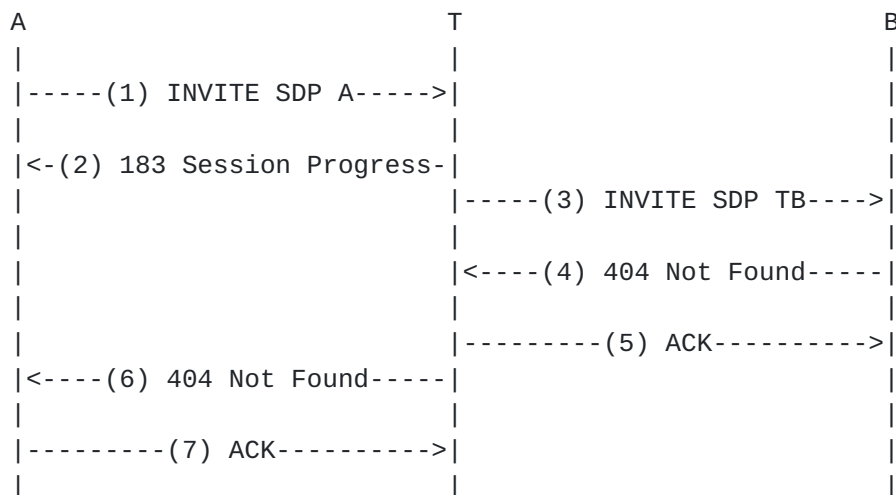

Figure 2: Unsuccessful session establishment

The problem with this flow is that the caller does not know whether the 404 (Not Found) response means that the initial INVITE (1) did not reach the transcoder or that the INVITE generated by the transcoder (4) did not reach the callee. To resolve this, it is recommended that the caller uses the reliable provisional responses [3] SIP extension.

Figure 3 shows the resulting message flow when the caller requires the use of the reliable provisional responses [3] SIP extension. The reception of the 183 (Session Progress) reliable provisional response

informs the caller that the transcoder was contacted successfully. So, the 404 (Not Found) response indicates that the callee could not be reached.

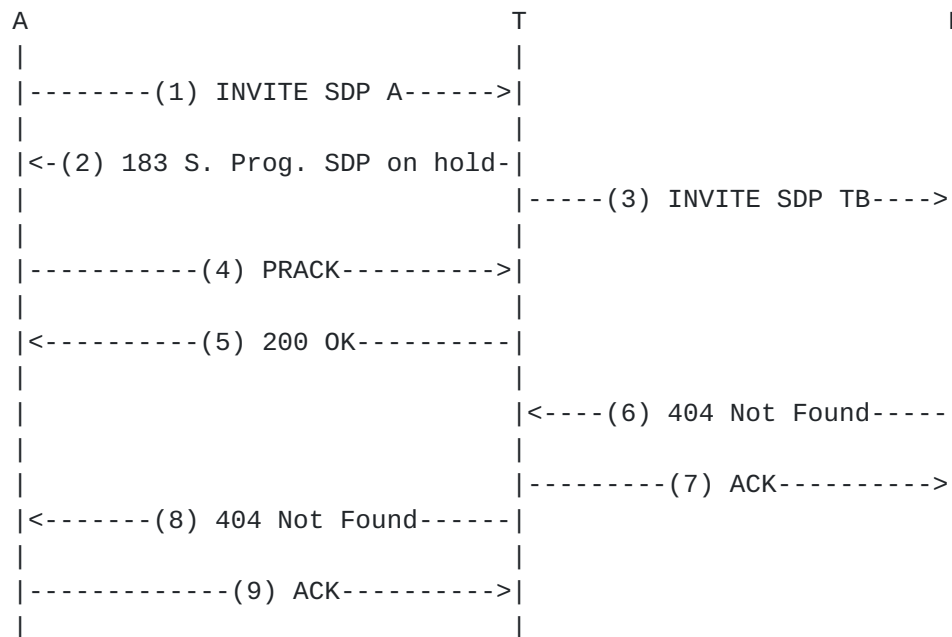

Figure 3: Invocation using reliable provisional responses

### 3 Callee's Invocation

If a UA receives an INVITE with an offer that is not acceptable, it can only invoke a transcoder if the caller supports the Replaces [4] extension. This support is indicated by the Supported header field in the INVITE.

If the caller (A) does not support Replaces, the callee (B) can always reject the session and attempt to establish a new session with A following the procedures in [Section 2](#). This way, B would act as a caller and, consequently, it would follow the procedures for caller's invocation of transcoders.

Assuming that the caller (A) supports Replaces, the callee (B) follows the steps shown in Figure 4 to invoke a transcoder. The callee sends a 183 (Session Progress) response (2) to the caller. This response carries a tag in the To header field. The caller needs to receive this To tag so that this early dialog can be replaced later in (5). So, the callee SHOULD use the reliable provisional

responses [3] SIP extension. The SDP in the 183 (Session Progress) response may put the media streams on hold. If the caller did not support this extension, the callee MAY send a 200 (OK) putting the media streams on hold.

OPEN ISSUE: can we use 0.0.0.0 instead of hold here?

After returning a response with a To tag to the caller, the callee sends an INVITE (2) to the Transcoder. The URI in the Request-URI of this INVITE contains a list parameter, as defined in [2] ([draft-camarillo-sipping-uri-list-01](#)), with a pointer to a URI list. This URI list contains a single URI: the URI received in the Contact header field of the initial INVITE (1) with an escaped Replaces header field, as shown in the following example:

```
sip:caller@client.chicago.example.com?Replaces=40d432fa84b4c76e66710;  
;from-tag=32331  
;to-tag=12dr45
```

We recommend the use of the reliable provisional responses between the callee and the transcoder so that the callee is able to distinguish between problems with the transcoder and problems with the caller, as we described in [Section 2.1](#).

When A receives this INVITE (5), it replaces the original dialog (1) with this new dialog. The caller sends a CANCEL (10) to cancel the original dialog (1) and receives a 487 (Request Terminated) response (11) from the callee.

#### [4](#) Security Considerations

TBD.

#### [5](#) Contributors

This document is the result of discussions amongst the conferencing design team. The members of this team include Eric Burger, Henning Schulzrinne and Arnoud van Wijk.

#### [6](#) OPEN ISSUES

In SIP, the Route header field is used to traverse proxies, but it seems that using it for traversing B2BUAs would be stretching its semantics too much.
