**YANG Data Model for DHCPv6 Configuration**  
**draft-cui-dhc-dhcpv6-yang-04**

## Abstract

There has no unified method to configure DHCPv6 server ,relay and client itself, always pre-configured manually by operators.

IETF netmod WG has developed a general data model for NETCONF protocol, YANG data model [[RFC6020](#)].

This document defines a YANG data model for the configuration and management of DHCPv6 server, DHCPv6 relay and DHCPv6 client. With this model, the operators can configure and manage the devices by using NETCONF.

## Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 28, 2016.

#### [1. Introduction](#)

This document defines a YANG data model for the configuration and management of DHCPv6 server, DHCPv6 relay and DHCPv6 client. With this model, the operators can configure and manage the devices by using NETCONF.

Model include three sub-modules:

Cui, et al.

Expires March 28, 2016

[Page 2]

- o DHCPv6 server
- o DHCPv6 relay
- o DHCPv6 client

For DHCPv6 client configuration, it is worth noting that as DHCPv6 itself a device configuration protocol, the intention of this document is not to replace client configuration of DHCPv6 options and parameters over the DHCPv6 protocol with the configuration of DHCPv6 options and parameters over NETCONF/YANG. The DHCPv6 client model is intended for the configuration of the DHCPv6 client function and also for obtaining read-only state data from the client which has been learnt via the normal DHCPv6 message flow. This gives an operator a better method for managing DHCPv6 clients and simplifies troubleshooting.

### **1.1. Terminology**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

The reader should be familiar with the terms defined in DHCPv6 [[RFC3315](#)] and relevant documents.

DHCPv6 tree diagrams provide a concise representation of a YANG module to help readers understand the module structure. The meaning if the symbols in these diagrams is as follows:

- o Brackets "[" and "]" enclose list keys.
- o Braces "{" and "}" enclose feature content.
- o Parentheses "(" and ")" enclose choice and case nodes, and case nodes are also marked with a colon ":".
- o Symbols after data node names: "?" means an optional node, and "\*" denotes a list and leaf-list.
- o Abbreviations before data node names: "rw" means configuration data (read-write), and "ro" means state data (read-only).

### **2. Objectives**

This document defines a YANG data model that can be used to configure and manage DHCPv6 server, DHCPv6 relay and DHCPv6 client.

Figure 1: DHCPv6 Data Model Structure

Introduction of important nodes:

- o **serv-attributes**: This container contains basic attributes of a DHCPv6 server such as DUID, server name and so on. Some optional functions that can be provided by the server is also included.
- o **duid**: Each server and client has only one DUID (DHCP Unique Identifier). The DUID here identifies a unique DHCPv6 server for

Cui, et al.

Expires March 28, 2016

[Page 9]

clients. DUID consists of a two-octet type field and an arbitrary length (no more than 128 bytes) content field.

- o pd-function: Whether the server can act as a delegating router to perform prefix delegation ([\[RFC3633\]](#)).
- o stateless-service: A boolean value specifies whether the server support client-server exchanges involving two messages defined in ([\[RFC3315\]](#)).
- o rapid-commit: Setting the value to '1' represents the server support the Solicit-Reply message exchange. '0' means the server will simply ignore the Rapid Commit option in Solicit message.
- o option-sets: DHCPv6 employs various options to carry additional information and parameters in DHCP messages. This container defines all the possible options that need to be configured at the server side. The relevant RFCs that define those options include: [\[RFC3315\]](#), [\[RFC3319\]](#), [\[RFC3646\]](#), [\[RFC3898\]](#), [\[RFC4242\]](#), [\[RFC4704\]](#), [\[RFC4833\]](#), [\[RFC5908\]](#), [\[RFC5970\]](#), [\[RFC4075\]](#), [\[RFC6334\]](#), [\[RFC6784\]](#), [\[RFC7078\]](#), [\[RFC7083\]](#), [\[RFC7291\]](#), [\[RFC7598\]](#).
- o option-set: A server may allow different option sets to be configured for different conditions (i.e. different networks, clients and etc). This "option-set" list enables various sets of options being defined and configured in a single server. Different sets are distinguished by the key called "option-set-id". All the possible options discussed above are defined in the list and each option is corresponding to a container. Since all the options in the list are optional, each container in this list has a boolean parameter called "enable" to indicate whether this option (container) will be included in the current option set or not. With the "new-option" container, it is easy to extend the model when new options are defined.
- o network-ranges: This model supports a hierarchy to achieve dynamic configuration. That is to say we could configure the server at different levels through this model. The top level is a global level which is defined as the container "network-ranges". The following levels are defined as sub-containers under it. The "network-ranges" contains the parameters (e.g. option-sets) that would be allocated to all the clients served by this server.
- o network-range: Under the "network-ranges" container, a "network-range" list is defined to configure the server at a network level which is also considered as the second level. Different network are identified by the key "network-range-id". This is because a

Cui, et al.

Expires March 28, 2016

[Page 10]

server may have different configuration parameters (e.g. option sets) for different networks.

- o address-pools: Under the "network-range" list, a container describes the DHCPv6 server's address pools for a specific network is defined. This container supports the server to be configured at a pool level.
- o address-pool: A DHCPv6 server can be configured with several address pools for a specific network. This list defines such address pools which are distinguish by the key called "pool-id".
- o binding-info: A list records a binding information for each DHCPv6 client that has already been allocated IPv6 addresses.
- o prefix-pools: If a server supports prefix delegation function, this container under the "network-range" list will be valid to define the delegating router's prefix pools for a specific network. This container also supports the server to be configured at a pool level.
- o prefix-pool: Similar to server's address pools, a delegating router can also be configured with multiple prefix pools specified by a list called "prefix-pool".
- o binding-info: A list records a binding information for each DHCPv6 requesting router that has already been configured IPv6 prefixes.
- o hosts: A server may also desire to be configured at a host level under some circumstances. This container include a list called "host" to allow the server carrying different parameters (e.g. option sets) for different hosts.
- o relay-opaque-paras: This container contains some opaque values in Relay Agent options that need to be configured on the server side only for value match. Such Relay Agent options include Interface-Id option, Remote-Id option and Subscriber-Id option.
- o rsoo-enabled-options: [[RFC6422](#)] requires that the server SHOULD have an administrator-configurable list of RS00-enabled options. This container include a list called "rsoo-enabled-option" to allow new RS00-enabled options to be defined at the server side.
- o packet-stats: A container presents the packet statistics related to the DHCPv6 server.

Introduction of important nodes:

- o **relay-attributes**: A container describes some basic attributes of the relay agent including some relay agent specific options data that need to be configured previously. Such options include Remote-Id option and Subscriber-Id option.
- o **dest-addrs**: Each DHCPv6 relay agent may be configured with a list of destination addresses. This node defines such a list of IPv6 addresses that may include unicast addresses, multicast addresses or other addresses.
- o **relay-supplied-options-option**: DHCPv6 relay agent could provide some information that would be useful to DHCPv6 client. Since relay agent cannot provide options directly to the client, [RFC6422] defines RS00-enabled options to propose options for the server to send to the client. This container modelled such RS00-enabled options.
- o **rsoo-set**: This list under the "relay-supplied-options-option" container is similar to the "option-set" defined in server feature. It allows the relay to implement several sets of RS00-

Cui, et al.

[Page 13]

enabled options for different interfaces. The list only include the EAP Re-authentication Protocol (ERP) Local Domain Name DHCPv6 Option defined in [[RFC6440](#)], since it is the only one RS00-enabled options accepted by IANA so far.

- o relay-interfaces: The "relay-interfaces" defines common configuration and state parameters of the interfaces belonging to a DHCPv6 relay agent.
- o relay-if: A list under "relay-interfaces" container that describes a specific interface and its corresponding parameters. Here we use a string called "if-name" as the key of list.
- o pd-route: A sub-container of "relay-if" which describes the route for delegated prefixes into the provider edge router.
- o next-entity: This node defines a list that is used to describe the next hop entity of this relay agent. Different entities are distinguished by their addresses.
- o packet-stats: A container shows packet state information of a specific data communication.
- o relay-stats: The "relay-stats" container records and presents the overall packet statistics of the relay agent.

```

Introduction of important nodes:

- o **client-interfaces**: A client may have several interfaces, it is more reasonable to configure and manage parameters on the interface-level. This container includes configuration and state data of a DHCPv6 client in a per-interface manner.
- o **client-if**: The list defines a specific client interface and its data. Different interfaces are distinguished by the "ifName" key which is a configurable string value.
- o **duid**: Each server and client has only one DUID (DHCP Unique Identifier). The DUID here will be carried in the Client ID option to identify a specific DHCPv6 client. This leaf are same as the "duid" leaf in "dhcpv6-server" feature.
- o **pd-function**: Whether the client can act as a requesting router to request prefixes using prefix delegation ([[RFC3633](#)]).
- o **rapid-commit**: '1' indicates a client can initiate a Solicit-Reply message exchange by adding a Rapid Commit option in Solicit message. '0' means the client is not allowed to add a Rapid Commit option to request addresses in a two-message exchange pattern.

Cui, et al.

Expires March 28, 2016

[Page 18]

- o mo-tab: The management tab label indicates the operation mode of the DHCPv6 client. ' $m'=1$  and ' $o'=1$ ' indicate the client will use DHCPv6 to obtain all the configuration data. ' $m'=1$  and ' $o'=0$ ' are a meaningless combination. ' $m'=0$  and ' $o'=1$ ' indicate the client will use stateless DHCPv6 to obtain configuration data apart from addresses/prefixes data. ' $m'=0$  and ' $o'=0$ ' represent the client will not use DHCPv6 but use SLAAC to achieve configuration.
- o oro-options: This container provide a way to configure the list of options that the client will request in its ORO option.
- o client-configured-options: Similar to the server, the client also need to configure some options to fulfil some desired functions. This container include all the potential options that need to be configured at the client side. The relevant RFCs that define those options include: [[RFC3315](#)], [[RFC4704](#)], [[RFC5970](#)], [[RFC6784](#)], [[RFC6939](#)].
- o identity-association: IA is a construct through which a server and a client can identify, group, and manage a set of related IPv6 addresses. The key of the "identity-association" list is a 4-byte number IAID defined in [[RFC3315](#)] .
- o if-other-paras: A client can obtain extra configuration data other than address and prefix information through DHCPv6 options. This container describes such data the client was configured through DHCPv6. The potential configuration data may include DNS server parameters, SIP server parameters and etc.
- o supported-options: This state data container defines a list of options supported by the client for administrator to interrogate a client's capabilities.
- o packet-stats: A container records all the packet status information of a specific interface.

### **3.4. Notifications Mechanism for DHCPv6**

```

++-rw dhcpv6
  +-+ ...
  |
  +-n notifications
    +-n dhcpv6-server-event           {dhcpv6-server}?
      | +-n pool-running-out
      |   | +-ro utilization-ratio      uint16
      |   | +-ro duid                  duidtype
      |   | +-ro serv-name?            string
      |   | +-ro pool-name             string
      | +-n invalid-client-detected

      +-n failed-status-turn-up
        +-ro duid                  duidtype
        +-ro status-code            enumeration

```

#### Introduction of notifications:

- o pool-running-out: raised when the address/prefix pool is going to run out. A threshold for utilization ratio of the pool has been defined in the server feature so that it will notify the administrator when the utilization ratio reaches the threshold, and such threshold is a settable parameter.
- o invalid-client-detected: raised when the server has found a client which can be regarded as a potential attacker. Some description could also be included.

- o topo-changed: raised when the topology of the relay agent is changed.
- o ia-lease-event: raised when the client was allocated a new IA from the server or it renew/rebind/release its current IA.
- o invalid-ia-detected: raised when the identity association of the client can be proved to be invalid. Possible condition includes duplicated address, illegal address, etc.
- o retransmission-failed: raised when the retransmission mechanism defined in [[RFC3315](#)] is failed.
- o failed-status-turn-up: raised when the client receives a message includes an unsuccessful Status Code option.

#### **4. DHCPv6 YANG Model**

This module imports typedefs from [[RFC6991](#)].

```
<CODE BEGINS> file "ietf-dhcpv6@2015-09-25.yang"
