IP Traffic Flow Security YANG Module
draft-fedyk-ipsecme-yang-iptfs-01

Abstract

This document describes a yang module for the management of IP Traffic Flow Security additions to IKEv2 and IPsec.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 19, 2021.

[1.](#) Introduction

This document defines a YANG module [[RFC7950](#)] for the management of the IP Traffic Flow Security (IP-TFS) extensions as defined in [[I-D.ietf-ipsecme-iptfs](#)]. IP-TFS provides enhancements to an IPsec tunnel Security Association to provide improved traffic confidentiality. Traffic confidentiality reduces the ability of traffic analysis to determine identity and correlate observable traffic patterns. IP-TFS offers efficiency when aggregating traffic in fixed size IPsec tunnel packets.

The YANG data model in this document conforms to the Network Management Datastore Architecture defined in [[RFC8342](#)].

The only actively published YANG modules for IPsec are found in [[I-D.ietf-i2nsf-sdn-ipsec-flow-protection](#)]. This document uses these models as a general IPsec model that can be augmented. The models in [[I-D.ietf-i2nsf-sdn-ipsec-flow-protection](#)] provide for an ike and an ikeless model.

[1.1.](#) Terminology & Concepts

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",

"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [\[RFC2119\]](#) [\[RFC8174\]](#) when, and only when, they appear in all capitals, as shown here.

2. Overview

This document defines configuration and operational parameters of IP traffic flow security (IP-TFS). IP-TFS, defined in [\[I-D.ietf-ipsecme-iptfs\]](#), configures a security association for tunnel mode IPsec with characteristics that improve traffic confidentiality and reduce bandwidth efficiency loss. These documents assume familiarity with IP security concepts described in [\[RFC4301\]](#).

IP-TFS uses tunnel mode to improve confidentiality by hiding inner packet identifiable information, packet size and packet timing. IP-TFS provides a general capability allowing aggregation of multiple packets and packet size control utilizing padding and additionally utilizing inner packet fragments when a complete inner packet will not fit in the IPsec outer tunnel packet. Zero byte padding is used to fill the packet when no data is available to send.

This document specifies an extensible configuration model for IP-TFS. This version utilizes the capabilities of IP-TFS to configure fixed size IP-TFS Packets that are transmitted at a constant rate. This model is structured to allow for different types of operation through future augmentation.

IP-TFS YANG augments IPsec YANG model from [\[I-D.ietf-i2nsf-sdn-ipsec-flow-protection\]](#). IP-TFS makes use of IPsec tunnel mode and adds a small number configuration items to tunnel mode IPsec. As defined in [\[I-D.ietf-ipsecme-iptfs\]](#), any SA configured to use IP-TFS supports only IP-TFS packets i.e. no mixed IPsec modes.

The behavior for IP-TFS is controlled by the source. The self-describing format of an IP-TFS packets allows a sending side to adjust the packet-size and timing independently from any receiver. Both directions are also independent, e.g. IP-TFS may be run only in one direction.

The data model uses following constructs for configuration and management:

- o Configuration
- o Operational State

This YANG module supports configuration of fixed size and fixed rate packets, and elements that may be augmented to support future configuration. The protocol specification [[I-D.ietf-ipsecme-iptfs](#)], goes beyond this simple fixed mode of operation by defining a general

format for any type of scheme. In this document the outer IPsec packets can be sent with fixed or variable size (without padding). The configuration allows the fixed packet size to be determined by the path MTU. The fixed packet size can also be configured if a value lower than the path MTU is desired.

Other configuration items include:

- o Congestion Control. A congestion control setting to allow IP-TFS to reduce the packet rate when congestion is detected.
- o Fixed Rate configuration. The IP-TFS tunnel rate can be configured taking into account either layer 2 overhead or layer 3 overhead. Layer 3 overhead is the IP data rate and layer 2 overhead is the rate of bits on the link. The combination of packet size and rate determines the nominal maximum bandwidth and the transmission interval when fixed size packets are used.
- o User packet Fragmentation Control. While fragmentation is recommended for improved efficiency, a configuration is provided if users wish to observe the effect no-fragmentation on their data flows.

The YANG operational data allows the readout of the configured parameters as well as the per SA statistics and error counters for IP-TFS. Per SA IPsec packet statistics are provided as a feature and per SA IP-TFS specific statistics as another feature. Both sets of statistics augment the IPsec YANG models with counters that allow observation of IP-TFS packet efficiency.

Draft [[I-D.ietf-i2nsf-sdn-ipsec-flow-protection](#)] has a mature set of IPsec YANG management objects.

IP-TFS YANG augments:

- o Yang catalog entry for ietf-i2nsf-ike@2020-10-30.yang
- o Yang catalog entry for ietf-i2nsf-ikeless@2020-10-30.yang

The Security Policy database entry and Security Association entry for an IPsec Tunnel can be augmented with IP-TFS.

[3.](#) YANG Management

[3.1.](#) YANG Tree

The following is the YANG tree diagram ([\[RFC8340\]](#)) for the IP-TFS extensions.

Internet-Draft IP Traffic Flow Security YANG Module November 2020

[4.](#) IANA Considerations

[4.1.](#) Updates to the IETF XML Registry

This document registers a URI in the "IETF XML Registry" [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration has been made:

URI:

urn:ietf:params:xml:ns:yang:ietf-ipsecme-iptfs

Registrant Contact:

The IESG.

XML:

N/A; the requested URI is an XML namespace.

[4.2.](#) Updates to the YANG Module Names Registry

This document registers one YANG module in the "YANG Module Names" registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registration has been made:

name:

ietf-ipsecme-iptfs

namespace:

urn:ietf:params:xml:ns:yang:ietf-ipsecme-iptfs

prefix:

iptfs

reference:

RFC XXXX (RFC Ed.: replace XXXX with actual RFC number and remove this note.)

[5.](#) Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such

as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The Network Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or

RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

The YANG module defined in this document can enable, disable and modify the behavior of IP traffic flow security, for the implications regarding these types of changes consult the [[I-D.ietf-ipsecme-iptfs](#)] which defines the functionality.

[6.](#) Acknowledgements

The authors would like to thank Eric Kinzie for his feedback on the YANG model.
