A YANG Data Model for requesting Path Computation in an Optical Transport Network (OTN)

Abstract

This document describes a YANG data model for a Remote Procedure Calls (RPC) to request Path Computation in an Optical Transport Network (OTN).

The YANG data models defined in this document conforms to the Network Management Datastore Architecture (NMDA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 29 December 2022.

1. Introduction

[[I-D.ietf-teas-yang-path-computation](#)] describes key use cases, where a client needs to request underlying SDN controllers for path computation. In some of these use cases, the underlying SDN controller can control an Optical Transport Network (OTN).

This document defines a YANG data model, which augment the generic Path Computation RPC defined in [[I-D.ietf-teas-yang-path-computation](#)], with OTN technology-specific augmentations required to request path computation to an underlying OTN SDN controller. These models allow a client to delegate path computation tasks to the underlying SDN controller without having to obtain OTN detailed information from the controller and performing feasible path computation itself.

The YANG data model defined in this document conforms to the Network Management Datastore Architecture [[RFC8342](#)].

1.1. Terminology and Notations

Refer to [[I-D.ietf-ccamp-otn-topo-yang](#)] and [[I-D.ietf-ccamp-layer1-types](#)] for the OTN specific terms used in this document.

The following terms are defined in [[RFC7950](#)] and are not redefined here:

- *client
- *server
- *augment
- *data model
- *data node

The following terms are defined in [[RFC6241](#)] and are not redefined here:

- *configuration data
- *state data

The terminology for describing YANG data models is found in [[RFC7950](#)].

1.2. Tree Diagram

A simplified graphical representation of the data model is used in [Section 3](#) of this document. The meaning of the symbols in these diagrams is defined in [[RFC8340](#)].

1.3. Prefix in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in [Table 1](#).

Prefix	YANG module	Reference
l1-types	ietf-layer1-types	[RFCYYYY]
te	ietf-te	[RFCZZZZ]
te-pc	ietf-te-path-computation	[RFCXXXX]
otn-pc	ietf-otn-path-computation	RFCXXXX

Table 1: Prefixes and corresponding YANG modules

RFC Editor Note: Please replace XXXX with the RFC number assigned to this document. Please replace YYYY with the RFC number assigned to [[I-D.ietf-ccamp-layer1-types](#)]. Please replace ZZZZ with the RFC number assigned to [[I-D.ietf-teas-yang-te](#)]. Please replace KKKK with the RFC number assigned to [[I-D.ietf-teas-yang-path-computation](#)]. Please remove this note.

2. YANG Data Model for OTN Path Computation

2.1. YANG Model Overview

The YANG data model for requesting OTN path computation is defined as an augmentation of the generic Path Computation RPC defined in [[I-D.ietf-teas-yang-path-computation](#)], as shown in [Figure 1](#).

Figure 1: Relationship between OTN and TE path computation models

The entities and Traffic Engineering (TE) attributes, such as requested path and tunnel attributes, defined in [[I-D.ietf-teas-yang-path-computation](#)], are still applicable when requesting OTN path computation and the models defined in this document only specifies the additional OTN technology-specific attributes/information, using the attributes defined in [[I-D.ietf-ccamp-layer1-types](#)].

The YANG module ietf-otn-path-computation defined in this document conforms to the Network Management Datastore Architecture (NMDA) defined in [[RFC8342](#)].

2.2. Bandwidth Augmentation

The OTN path computation model augments all the occurrences of the te-bandwidth container with the OTN technology-specific attributes using the otn-link-bandwidth and otn-path-bandwidth groupings defined in [[I-D.ietf-ccamp-layer1-types](#)].

2.3. Label Augmentations

The OTN path computation model augments all the occurrences of the label-restriction list with OTN technology-specific attributes using the otn-label-range-info grouping defined in [[I-D.ietf-ccamp-layer1-types](#)].

Moreover, the model augments all the occurrences of the te-label container with the OTN technology-specific attributes using the otn-

label-start-end, otn-label-hop and otn-label-step groupings defined in [[I-D.ietf-ccamp-layer1-types](#)].

3. OTN Path Computation Tree Diagram

[Figure 2](#) below shows the tree diagram of the YANG data model defined in module ietf-otn-path-computation.yang.

<CODE ENDS>

Figure 3: OTN path computation YANG module

5. Manageability Considerations

TBD.

6. Security Considerations

<Add any security considerations>

7. IANA Considerations

This document registers the following URIs in the "ns" subregistry within the "IETF XML registry" [[RFC3688](#)].

URI: urn:ietf:params:xml:ns:yang:ietf-otn-path-computation

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

This document registers the following YANG module in the "YANG Module Names" registry [[RFC7950](#)].

name: ietf-otn-path-computation

namespace: urn:ietf:params:xml:ns:yang:ietf-otn-path-computation

prefix: otn-pc

reference: this document
