**CLI forwarding method during call transfer  
draft-giordano-cli-forward-in-call-trx-01**

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

Many telephony services are IP based and they can use various signaling protocols like H.323, SIP, MGCP, MEGACO and vendor proprietary protocols. This document describe a method to identify and to change the Calling Line Identification (or CLI) field during call forwarding. This method is voice over ip protocol independent. This method can be apply to all voice over ip protocols.

**1. Conventions Used In This Document**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

**2. Introduction**

In POTS/PSTN networks the CLI (Calling Line Identification) is a base information about the billing telephone number from which calls are originated. CLI can be managed to obtain various services: CLI presentation or CLIP, CLI restriction or CLIR, CLI stripping, CLI screening and other well known services.

These cases are implemented in IP based telephony network or voice over IP network.

But, What happens during call forwarding?

In traditional telephony, two calling line ids are sent along with the outgoing call.

It doesn't happen in the current IP implementations.

There is a need for a mechanism to identify the originating party and to send the appropriate CLI.

**3. Implementation and Operations**

When a call is forwarded (unconditionally, on busy and not answered) we MUST identify three parties: the calling party A, the called transferor party B and the transferred party C.

call flow

A -----> B -----> C

During call setup A sends its CLI to B.

B can send both CLI, its own and CLI of A.

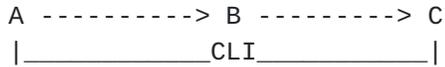

CLI of A SHOULD be called original-CLI; CLI of B SHOULD be called transferor-CLI.

What happens to CLI in this scenario?

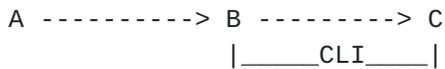

We MUST identify two cases:

- 1) CLI pass through: the transferred party C MUST receive the original-CLI

- 2) CLI override: the transferred party C MUST receive the transferor-CLI

Who set the forwarding MUST select a CLI forwarding method. In this way the appropriate caller line id can be sent during call setup.

This implementation would be protocol independent. All signaling protocols describe how to write CLI information in own signaling message.

#### 4. Consideration about well known services

This draft doesn't influence the correct working of well known services like CLI Presentation or CLI Restriction. Their working is described in all signaling voice protocols.

## **5. Security Considerations**

This document is not directly concerned with security. However, implementing this feature you can obtain more control over call routing and more information in the call report.

## **6. IANA Considerations**

None.

## **7. Normative References**

[RFC2119] Bradner, S., "Key words for use in RFCs to Indicate Requirement Levels", [BCP 14](#), [RFC 2119](#), March 1997.
