Explicit Congestion Notification (ECN) Deployment Observations

## Abstract

This note presents data gathered at an Internet Service Provider's gateway on the observed deployment and usage of ECN. Relevant IP counter and flow tracking data was collected and analyzed for TCP and other protocols.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current InternetDrafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 22 August 2021.

Author's Address

1. Introduction

To help guide the evolution of ECN, there is a need for more data on current deployment status, and observed usage of the ECN related bits, including:
*the initiation and acceptance of ECN capable TCP flows
*marking via CE, and feedback for TCP via the ECE and CWR flags
*codepoints set on packets for protocols other than TCP

For several weeks, we gathered data on all traffic through an Internet Service Provider's gateway. Though some of the results are informative, we caution that a larger, more widely reviewed and geographically distributed survey would be needed to be authoritative.

## 2. Collection Details

From December 28, 2020 to January 20, 2021, data was gathered on all traffic into and out of the Internet gateway at FreeNet Liberec, a cooperative WISP in an urban area of the Czech Republic. A total of 122.5 TB of incoming data and 12 TB of outgoing data was seen.

Around 660 members belong to the ISP, and 861 member IP addresses on the LAN were considered active during data collection. Most member IPs are used by a household of users, while others are for individual devices and public locations.
[IPTABLES-ECN] was used to collect and analyze the data. This consists of a script to gather the data using iptables and ipsets in Linux, and an analysis program that produces textual output. An abbreviated version of the output is included in Section 5. See the referred to source repository for more details and full output.

## 3. Observations

Our key observations are summarized as follows, and further expanded upon in the following sections:
*1.44\% of TCP flows initiated ECN, across $45 \%$ of member IPs.
*The acceptance rate for ECN flows was likely >50\%.
*24\% of member IPs that negotiated TCP ECN flows saw apparent AQM marking via CE or ECE, with more congestion observed on the downstream.
*42\% of the member IPs that saw CE or ECE were from subnets that have known AQM instances in the ISP's backhaul, and the remainder appear to be from unknown AQMs.
*Nonzero ECN codepoints were observed on $0.053 \%$ of non-TCP packets, with possible attribution to tunneled ECN and/or misuse of the ECN field.

### 3.1. ECN Endpoint Activity

### 3.1.1. Client Initiation

Of 319.5 million TCP SYNs from LAN to WAN, $1.44 \%$ indicated ECN capability. Of 861 active member IP addresses, 390 (45.3\%) attempted initiation for at least one ECN flow. A large proportion of the ECN flows are thought to come from Apple devices.

### 3.1.2. Server Acceptance

While 4.6 million ECN TCP SYNs were seen from LAN to WAN, 3.3 million ECN SYN-ACKs were seen in return. While it's not possible to get an exact ECN acceptance rate from this, it appears to be reasonably high, likely due to default acceptance on prevailing server operating systems like Linux, FreeBSD and recent versions of Windows Server.

### 3.2. RFC3168 AQM Activity

There appears to be evidence of [RFC3168] marking AQMs. Of 861 active member IP addresses:
*382 member IPs, or 44\%, successfully negotiated any TCP ECN flows
*90 member IPs, or $24 \%$ of those that negotiated ECN, saw any CE or ECE marks on negotiated TCP ECN flows

Two backhaul links have fq_codel [RFC8290] deployed, serving the $10.45 .64 .0 / 24$ and $10.45 .235 .0 / 24$ subnets. This accounts for 38 of the 90 member IP addresses that saw CE or ECE, with the source of the remaining $C E$ and ECE marks unknown. These are presumed to be from other [RFC3168] marking AQM instances.

Note that depending on the position of the marking AQM relative to the gateway, CE marks may not be seen on some packets, while TCP ECE flags are seen in the opposite direction. For a number of member IP addresses, we saw 0 CE marks downstream, but ECE flags set upstream, suggesting an AQM downstream from the gateway marking downstream traffic.

### 3.3. ECN Codepoints on Non-TCP Protocols

Referring to the packet counts in the All IP / Both Directions table in the stats output in Section 5, where M indicates megapackets and G, gigapackets:

|  | TCP | Conntrack (X) | Other | Total |
| :--- | :--- | :--- | :--- | :--- |
| All | 76.60 G | $->$ | 43.52 G | 120.14 G |
| CE | 10031 | 3.38 M | 813951 | 4.20 M |
| ECT (0) | 523.91 M | 9.66 M | 2.55 M | 536.12 M |
| ECT(1) | 63 | 6.68 M | 182928 | 6.86 M |
| Table 1 |  |  |  |  |

(X) UDP, ICMP, DCCP, SCTP, GRE (Conntrack All packets included in Other)

We note the following:
*TCP accounted for $97.7 \%$ of the 536 million ECT(0) marks

* $0.68 \%$ of all TCP packets were marked with a nonzero ECN codepoint
*0.053\% of all non-TCP packets were marked with a nonzero ECN codepoint
*Non-TCP accounted for $99.8 \%$ of the 4.2 million CE marks
*Non-TCP accounted for virtually all of the ECT(1) marks

Possible explanations for ECN marks on non-TCP packets are explored further in this section.

### 3.3.1. Tunneled Traffic

There are several different encapsulation methods used when handling the ECN field through tunnels, as per [RFC3168] and [RFC6040]:

1. copy the ECN field from the inner to the outer packet
2. reset the ECN field on the outer packet to ECT(0)
3. set Not-ECT on the outer packet

When method 3 is used at both ends of a tunnel, we would not expect to see ECN codepoint usage in either direction.

When methods 1 or 2 are used at both ends of a tunnel, we would expect to see ECT(0) on both incoming and outgoing packets. We would also expect a bias towards incoming packets, since more data is generally downloaded than uploaded, and pure ACKs do not have ECT(0) marks.

When method 3 is used at only one end of the tunnel, we would expect to see ECT(0) on packets in only one direction.

We note the following:
*Bi-directional ECT(0) marks were observed for two member IP / port pairs, on UDP port 443 and 60001.
*Uni-directional ECT(0) marks were observed for:
-UDP port 4500 (IPSec NAT traversal [RFC3948]) with 23 member IP addresses downstream, and 1 member IP address upstream.
-UDP port 51820 [WIREGUARD] with 2 member IP addresses downstream.
-Numerous UDP ports in other ranges, mostly on the downstream.

While it's possible that some of the data observed was from tunneled ECN traffic, this can't be established definitively.

### 3.3.2. Use of the ECN Field for Historical Reasons

Some applications may still use historical definitions of the former TOS byte. Although RFC791 reserved the ECN field for future use, the now obsolete [RFC1349] defined the TOS field as four bits within the Type of Service octet, one of which overlaps with the ECN field.
This may account for some of the observed usage of ECT(0), since the value for "minimize monetary cost" was 0001, shifted to the left one bit, coinciding with ECT(0).

### 3.3.3. Use of the ECN Field Inadvertently

Users of operating system's socket APIs wishing to set a DiffServ codepoint may be confused as to whether or not they need to shift the desired value left two bits before passing it in. Additionally, OS header files have been seen with out-of-date definitions for obsolete values in the former Type of Service octet, and obsolete definitions from [RFC2481].

Another possible source of confusion is the TOS field values listed in the now obsolete [RFC1349], without having been shifted. A casual reader could see the value 0001 for "minimize monetary cost" and think that they should use this value in the TOS byte, conflicting with ECT(1), not realizing that:
*[RFC1349] is obsolete
*even if it weren't obsolete, the TOS values must be shifted to the left by one bit

To reduce incorrect usages of the DS field, OS header files should be sanitized, obsolete RFCs more prominently marked as such, and API documentation brought up to date.

### 3.3.4. Use of the ECN Field Maliciously

It's possible that some software is using the ECN field to gain an advantage in Internet queues or for some other nefarious purpose. Further analysis would be needed to determine if this is the case.

## 4. Study Limitations and Recommendations for Future Work

### 4.1. ECN Acceptance Rate

While we captured the ratio of ECN SYNs to ECN SYN-ACKs, we do not have an exact count of flows that were accepted or rejected. It may be possible to do this more accurately with additional iptables rules in [IPTABLES-ECN].

### 4.2. Tunnels

Tunnel protocols are challenging because of the different encapsulation methods and protocols used. An analysis at the flow level, rather than by IP address and destination port pairs, might be more useful in identifying the usage of ECN over tunnels.

### 4.3. Non-TCP Protocols

More research is needed into the reasons for ECN codepoints being set on non-TCP traffic. Given the relatively low volume of this traffic, it might be practical to take packet captures of it for further analysis.

Additionally, we are currently not able to differentiate between the total number of packets for conntrack-supported and Other protocols. This could be improved with some changes to [IPTABLES-ECN].

### 4.4. Other Protocols

While this study looked at signals by IP address for TCP and IP/port for conntrack-supported protocols, it does not break down signals for Other protocols by IP address. Among those protocols is IPSec ESP packets, using IP protocol 50. The [IPTABLES-ECN] script could be modified to create more ipsets of type hash:ip, parallel to what was done for IP traffic as a whole, to further analyze these protocols for tunnel activity.

### 4.5. NS Flag

Since [RFC8311] declared that the NS (Nonce Sum) flag is again Reserved, after its now historical use by [RFC3540], we could collect any observed usages of this flag, to confirm that it's available for use in practice.

## 5. Abbreviated Output from ecn-stats

This abbreviated output only includes LAN to WAN flows, and a small subset of the non-TCP conntrack protocols by member IP address. For full output, see the [IPTABLES-ECN] repository.

Note the IP addresses shown here have been anonymized within the 10.0.0.0/8 address space, in a way that retains the subnet structure.

### 5.1. All IP

Packets, CE, ECT(0) and ECT(1) are packet counts, and use units of $M, \mathrm{G}$ or T for mega, giga, or terapackets.

Total (both directions):

|  | TCP | Conntrack [*] | Other | Total |
| :---: | :---: | :---: | :---: | :---: |
| Bytes | 101.22 TВ | -> | 33.22 TB | 134.46 TB |
| Packets | 76.60 G | -> | 43.52 G | 120.14 G |
| \|-CE | 10031 | 3.38 M | 813951 | 4.20 M |

[*] Conntrack protocols: UDP, ICMP, DCCP, SCTP, GRE Conntrack total Bytes and Packets included in Other
5.2. TCP initiated from LAN to WAN

IP address counts with TCP and ECN activity:

```
Active (sent >= 10 SYNs): 861 (of 1195)
Initiated any ECN flows: 390 (45.3%)
Negotiated any ECN flows: 382 (44.4%)
Saw CE or ECE on ECN flow: 90 (23.6% of ECN, 10.5% of all)
Saw ECT(1) on ECN flow:
5
```

SYN packet count totals for active IPs:

```
All SYNs: 319560652
ECN SYNs: 4601118 (1.44% of all)
ECN SYN/ACKs: 3273815 (71.15% of ECN SYNs)
```

ECN packet count totals for active IPs:

```
Direction CE ECE ECT(0) ECT(1)
-------- -- --- ----- -----
From LAN 733 502985 42903861 1
From WAN 9298 19367 479756419 62
```

ECN congestion signals by active IP:

| IP |  | ECE fr |  | ECE |
