**vCard Format Extensions: Internet Corporation for Assigned Names and Numbers (ICANN) Extensions for the Registration Data Access Protocol (RDAP)**

[draft-hollenbeck-vcarddav-icann-rdap-extensions-01](#)

## Abstract

This document defines extensions to the vCard data format for representing and exchanging contact information used to implement the Internet Corporation for Assigned Names and Numbers (ICANN) operational profile for the Registration Data Access Protocol (RDAP). The property and parameter defined here are used to add values to RDAP responses that are consistent with ICANN policies.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 14, 2019.

**1. Introduction**

The Temporary Specification for gTLD Registration Data [1] was published by the Internet Corporation for Assigned Named and Numbers (ICANN) in 2018. The Temporary Specification includes requirements that cannot currently be met by the Registration Data Access Protocol (RDAP, [RFC7483]) without extending the underlying vCard [RFC6350] specification used to represent RDAP entity objects. This document includes specifications for an additional vCard property and an additional vCard parameter to meet the requirements of the Temporary Specification.

**1.1. Terminology Used in This Document**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

Syntax specifications shown here use the augmented Backus-Naur Form (ABNF) as described in [RFC5234], and are specified as in the base vCard specification [RFC6350].

## **2. vCard Extensions: Properties**

This document describes one new vCard extension property.

### **2.1. Property: CONTACT-URI**

Namespace:

Property name: CONTACT-URI

Purpose: RDAP entity information can be redacted under certain circumstances (e.g., privacy). The Temporary Specification requires that RDAP entity objects representing "Registrant", "Admin", and "Tech" contacts contain an email address or a location for a web form to facilitate email communication with the relevant contact in a way that does not identify the associated individual. The CONTACT-URI property can be used to include URIs representing an email address or a location for a web form.

Value type: A single URI value.

Cardinality: \*

Property parameters: PREF

Description: At least one "mailto", "http", or "https" URI value MUST be provided. Additional CONTACT-URI properties MAY be provided to describe other contact methods. If multiple CONTACT-URI properties are used, the vCard PREF parameter MUST be used to describe the most preferred property as described in [Section 5.3 of RFC 6350](#) [[RFC6350](#)].

Format definition:

CONTACT-URI-param = "VALUE=uri" / pref-param ; pref-param from [[RFC6350](#)]

CONTACT-URI-value = uri ; uri from [[RFC3986](#)]

Examples:

CONTACT-URI:https://contact.example.com

CONTACT-URI;PREF=1:mailto:contact@example.com

## **3. vCard Extensions: Parameters**

This document describes one new vCard extension parameter.

### **3.1. Parameter: CC**

Namespace:

Parameter name: CC

Purpose: ICANN requires the use of ISO 3166 [[ISO.3166.1988](#)] two-letter codes, not "country names", in RDAP entity responses. This parameter is used to extend the ADR property described in [Section 6.3.1 of RFC 6350](#) [[RFC6350](#)].

Description: This parameter contains the ISO 3166 [[ISO.3166.1988](#)] 2-character country code associated with the "country name" ADR component described in [Section 6.3.1 of RFC 6350](#) [[RFC6350](#)].

Format definition:

CC-param = "CC=" 2ALPHA

Examples:

ADR;TYPE=work;CC=US;;;54321 Oak St;Reston;VA;20190;USA

ADR;TYPE=home;CC=US;;;12345 Elm St;Reston;VA;20190;USA

## **4. IANA Considerations**

IANA is requested to add the following entry to the vCard Properties registry defined in [Section 10.3.1 of RFC 6350](#) [[RFC6350](#)].

Namespace:

Property: CONTACT-URI

Reference: RFCXXXX (this RFC), [Section 2.1](#)

IANA is requested to add the following entry to the vCard Parameters registry defined in [Section 10.3.2 of RFC 6350](#) [[RFC6350](#)].

Namespace:

Property: CC

Reference: RFCXXXX (this RFC), [Section 3.1](#)

## 5. Security Considerations

The CONTACT-URI value is purposefully intended to be a publicly visible contact reference, and as such, it cannot require confidentiality protection. There are, however, privacy implications in the choice of a URI scheme for the web form contact method. An "https" URI value can be used to indicate support for confidentiality protection for connections to the server that publishes the web form. This document presents no other security considerations beyond those described in [Section 9](#) of the base vCard specification [[RFC6350](#)].

## 6. Acknowledgements

The author would like to acknowledge the following individuals for their contributions to the development of this document: Rick Wilhelm.
