**Internationalization Updates to [RFC 5280](#)  
draft-housley-rfc5280-i18n-update-00**

Abstract

These updates to [RFC 5280](#) provide clarity on the handling of Internationalized Domain Names (IDNs) and Internationalized Email Addresses in X.509 Certificates.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/1id-abstracts.html>

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>

Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

## **1. Introduction**

These updates to the Introduction and [Section 7 of RFC 5280](#) [[RFC5280](#)] provide clarity on the handling of Internationalized Domain Names (IDNs) and Internationalized Email Addresses in X.509 Certificates.

IDNs are converted to punycode. The punycode form is carried in certificate, and the punycode form is used to compare two IDNs.

The conversion to punycode is defined in [Section 4 of RFC 3490](#) [[RFC3490](#)]. In addition, [Section 7.2 of RFC 5280](#) [[RFC5280](#)] provides some guidance about the flags used in that process. That guidance is not changed by this update.

Note that Internationalized Domain Names in Applications specification published in 2008 (IDNA2008) [[RFC5891](#)][[RFC5892](#)] also refer to [RFC 3490](#) for the conversion to punycode.

Internationalized Email Addresses that contain non-ASCII characters in the local-part of the address follow the conventions recently specified by the IETF LAMPS working group.

### **1.1. Terminology**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

## **2. Updates**

This section provides updates to several paragraphs in the Introduction and [Section 7 of RFC 5280](#) [[RFC5280](#)]. For clarity, the original text and the replacement text are shown.

## **2.1. Update in [Section 1](#), Introduction**

OLD

- \* Enhanced support for internationalized names is specified in [Section 7](#), with rules for encoding and comparing Internationalized Domain Names, Internationalized Resource Identifiers (IRIs), and distinguished names. These rules are aligned with comparison rules established in current RFCs, including [\[RFC3490\]](#), [\[RFC3987\]](#), and [\[RFC4518\]](#).

NEW

- \* Enhanced support for internationalized names is specified in [Section 7](#), with rules for encoding and comparing Internationalized Domain Names, Internationalized Resource Identifiers (IRIs), and distinguished names. These rules are aligned with comparison rules established in current RFCs, including [\[RFC3490\]](#), [\[RFC3987\]](#), [\[RFC4518\]](#), [\[RFC5890\]](#), and [\[RFC5891\]](#).

## **2.2. Update in [Section 7.2](#), IDNs in GeneralName**

OLD

IA5String is limited to the set of ASCII characters. To accommodate internationalized domain names in the current structure, conforming implementations MUST convert internationalized domain names to the ASCII Compatible Encoding (ACE) format as specified in [Section 4 of RFC 3490](#) before storage in the dNSName field. Specifically, conforming implementations MUST perform the conversion operation specified in [Section 4 of RFC 3490](#), with the following clarifications:

...

Implementations should convert IDNs to Unicode before display. Specifically, conforming implementations should perform the conversion operation specified in [Section 4 of RFC 3490](#), with the following clarifications:

NEW

IA5String is limited to the set of ASCII characters. To accommodate internationalized domain names in the current structure, conforming implementations MUST convert IDNs [\[RFC5890\]](#)[\[RFC5891\]](#) to the ASCII Compatible Encoding (ACE) format as specified in [Section 4 of \[\\[RFC3490\\]\]\(#\)](#) before placement in the dNSName field. Specifically,

conforming implementations MUST perform the conversion operation specified in [Section 4 of \[RFC3490\]](#), with the following clarifications:

...

Implementations should convert IDNs to Unicode before display. Specifically, conforming implementations should perform the conversion operation specified in [Section 4 of \[RFC3490\]](#), with the following clarifications:

### **[2.3.](#) Update in [Section 7.3](#), IDNs in Distinguished Names**

OLD

Domain Names may also be represented as distinguished names using domain components in the subject field, the issuer field, the subjectAltName extension, or the issuerAltName extension. As with the dNSName in the GeneralName type, the value of this attribute is defined as an IA5String. Each domainComponent attribute represents a single label. To represent a label from an IDN in the distinguished name, the implementation MUST perform the "ToASCII" label conversion specified in [Section 4.1 of RFC 3490](#). The label SHALL be considered a "stored string". That is, the AllowUnassigned flag SHALL NOT be set.

NEW

Domain Names may also be represented as distinguished names using domain components in the subject field, the issuer field, the subjectAltName extension, or the issuerAltName extension. As with the dNSName in the GeneralName type, the value of this attribute is defined as an IA5String. Each domainComponent attribute represents a single label. To represent a label from an IDN in the distinguished name, the implementation MUST perform the "ToASCII" label conversion specified in [Section 4.1 of \[RFC3490\]](#). The label SHALL be considered a "stored string". That is, the AllowUnassigned flag SHALL NOT be set.

### **[2.4.](#) Update in [Section 7.5](#), Internationalized Electronic Mail Addresses**

OLD

Electronic Mail addresses may be included in certificates and CRLs in the subjectAltName and issuerAltName extensions, name constraints extension, authority information access extension, subject information access extension, issuing distribution point extension,

or CRL distribution points extension. Each of these extensions uses the GeneralName construct; GeneralName includes the rfc822Name choice, which is defined as type IA5String. To accommodate email addresses with internationalized domain names using the current structure, conforming implementations MUST convert the addresses into an ASCII representation.

Where the host-part (the Domain of the Mailbox) contains an internationalized name, the domain name MUST be converted from an IDN to the ASCII Compatible Encoding (ACE) format as specified in [Section 7.2](#).

Two email addresses are considered to match if:

- 1) the local-part of each name is an exact match, AND
- 2) the host-part of each name matches using a case-insensitive ASCII comparison.

Implementations should convert the host-part of internationalized email addresses specified in these extensions to Unicode before display. Specifically, conforming implementations should perform the conversion of the host-part of the Mailbox as described in [Section 7.2](#).

#### NEW

Electronic Mail addresses may be included in certificates and CRLs in the subjectAltName and issuerAltName extensions, name constraints extension, authority information access extension, subject information access extension, issuing distribution point extension, or CRL distribution points extension. Each of these extensions uses the GeneralName construct. If the email address includes an IDN but the local-part of the email address can be represented in ASCII, then the email address is placed in the rfc822Name choice of GeneralName, which is defined as type IA5String. If the local-part of the internationalized email address cannot be represented in ASCII, then the internationalized email address is placed in the otherName choice of GeneralName using the conventions in [[ID.lamps-eai-addresses](#)].

##### 7.5.1. Local-part Contains Only ASCII Characters

Where the host-part contains an IDN, conforming implementations MUST convert the domain name into an ASCII representation using the ASCII Compatible Encoding (ACE) format as specified in [Section 7.2](#).

Two email addresses are considered to match if:

- 1) the local-part of each name is an exact match, AND
- 2) the host-part of each name matches using a case-insensitive ASCII comparison.

Implementations should convert the host-part of internationalized email addresses specified in these extensions to Unicode before display. Specifically, conforming implementations should perform the conversion of the host-part of the Mailbox as described in [Section 7.2](#).

#### 7.5.2. Local-part Contains Non-ASCII Characters

When the local-part contains non-ASCII character, conforming implementations MUST be placed in the Smtputf8Name within the otherName choice of GeneralName as specified in Section 3 of [\[ID.lamps-eai-addresses\]](#). Note that the UTF8 encoding of the internationalized email address MUST NOT contain a Byte-Order-Mark (BOM) [\[RFC3629\]](#) to aid comparison.

The comparison of two internationalized email addresses is specified in Section 4 of [\[ID.lamps-eai-addresses\]](#).

Implementations should convert the local-part and the host-part of internationalized email addresses placed in these extensions to Unicode before display.

### 3. Security Considerations

The security considerations in [RFC 5280](#) [\[RFC5280\]](#) are not changed by this update.

### 4. IANA Considerations

No IANA registries are changed by this update.
