**IPv6CP Options for PPP Host Configuration**  
**draft-huang-ipv6cp-options-00**

Abstract

The Softwire Hub and Spoke Framework document outlines three steps for the Softwire Initiator (SI) and PPP peer of the Softwire Concentrator (SC) over IPv4 connectivity to be fully configured for IPv6 once the PPP session has been established. For the same function over IPv6 connectivity, however, only one additional step is needed. This is because IPv6CP only defines the Interface-Identifier option. This document defines additional host configuration options for IPv6CP so that the operational model of IPCP is extended to IPv6CP to reduce requirements on the SI and SC.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on August 7, 2010.

## **1. Introduction**

The Softwire Hub and Spoke framework document [[RFC5571](#)] outlines three steps for the Softwire Initiator (SI) and PPP peer of the Softwire Concentrator (SC) over IPv4 connectivity to be fully configured for IPv6 once the PPP session has been established. For the same function over IPv6 connectivity, however, only one additional step is needed. This is because IPv6CP [[RFC5072](#)] only defines the Interface-Identifier option. This document defines additional host configuration options for IPv6CP so that the operational model of IPCP is extended to IPv6CP to reduce requirements on the SI and SC.

Other use cases where IPv6CP can completely configure the PPP endpoint is the traditional VPN concentrator space, where the concentrator assigns all IP configuration parameters to the VPN client for IPv4.

### **1.1. Requirements Language**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

## **2. IPv6CP Configuration Options**

IPv6CP [[RFC5072](#)] defines the Interface-Identifier configuration option. Successful negotiation of the Interface-Identifier allows further configuration parameters via Stateless Autoconfiguration.

The following IPv6CP options are defined in this document. Up-to-date values of the IPv6CP Option Type field are specified in the online database of "Assigned Numbers" maintained by IANA.

### **2.1. Prefix**

This option and Prefix-Length provide the IPv6 prefix information to the device.

```

0                               1                               2                               3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|      Type      |      Length      |      Prefix (msb)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
                        Prefix (cont)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
... ..
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
                        Prefix (lsb)      |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

Type

2

Length

18

Prefix

The IPv6 prefix that should be used on the link to construct the globally unique IPv6 address.

Default

None

## [2.2.](#) Prefix-Length

This option and Prefix provide the IPv6 prefix information to the device.

```

0                               1                               2                               3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|      Type      |      Length      |Prefix-Length |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

Type

3

Length

3

## Prefix-Length

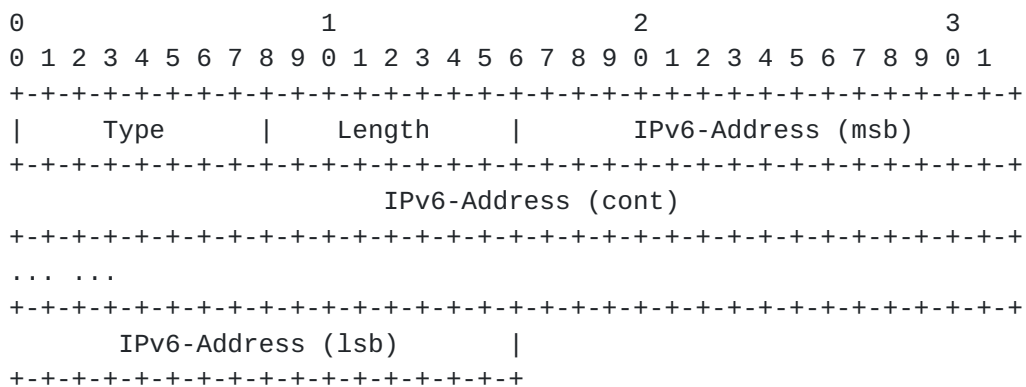

The length of the IPv6 prefix that should be used on the link to construct the globally unique IPv6 address.

Default

None

### 2.3. IPv6-Address

This option provides the IPv6 address to be configured on the PPP peer for the PPP link. This is an alternative for the IPv6 address assignment/generation process where the gateway/SC completely controls the configuration of the PPP peer.

Type

4

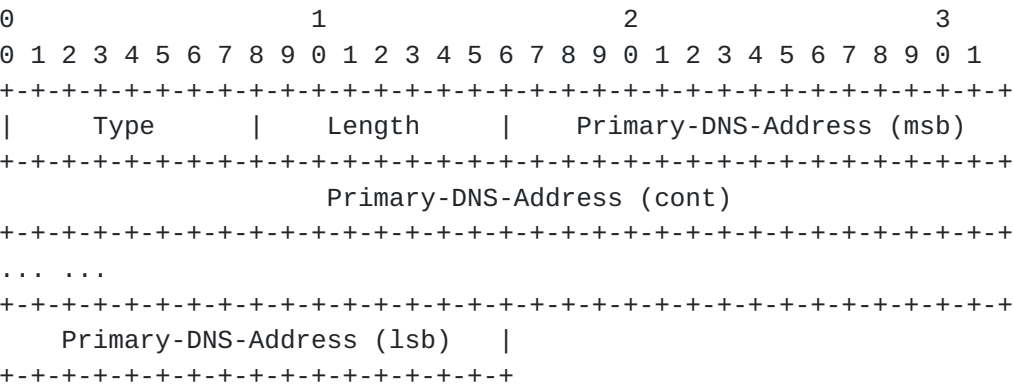

Default

None

2.5. Primary-DNS-Address

This option provides the IPv6 address of the primary DNS server that should be configured on the PPP peer.

Type

6

Length

18

Primary-DNS-Address

The IPv6 address of the primary DNS server.

Default

None

2.6. Secondary-DNS-Address

This option provides the IPv6 address of the secondary DNS server that should be configured on the PPP peer.

```

0                               1                               2                               3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|   Type   |   Length   |   Secondary-DNS-Address (msb)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
                        Secondary-DNS-Address (cont)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
... ..
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
      Secondary-DNS-Address (lsb)  |
+---+---+---+---+---+---+---+---+

```

Type

7

Length

18

Secondary-DNS-Address

The IPv6 address of the secondary DNS server.

Default

None

## 2.7. Delegated-Prefix

This option and Delegated-Prefix-Length provide information on the IPv6 prefix delegated to the device.

```

0                               1                               2                               3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|   Type   |   Length   |   Delegated-Prefix (msb)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
                        Delegated-Prefix (cont)
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
... ..
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
      Delegated-Prefix (lsb)      |
+---+---+---+---+---+---+---+---+

```

Default

None

### **3. Security Considerations**

No new security concerns raise out of this document.

### **4. IANA Considerations**

IANA is requested to assign values 2 through 9 for the Type field for the IPv6CP configuration options specified in this document.
