Super-Channel Optical Parameters GMPLS Signaling Extensions
draft-hussain-ccamp-super-channel-param-sig-02.txt

Abstract

This document builds on [6][7] and defines GMPLS signaling extensions to carry super-channel optical parameters for efficient spectrum assignment on flexible grid networks.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on March 1, 2013.

[1. Introduction](#)

Future transport systems are expected to support service upgrades to data rates of 1 Tbps and beyond. To scale networks beyond 100Gbps, multi-carrier super-channels coupled with advanced multi-level modulation formats and flexible channel spectrum bandwidth allocation schemes have become pivotal for future spectral efficient transport network architectures [[1](#),[2](#)].

The coexistence of super-channels using different modulation formats on the same optical fiber network infrastructure may have a detrimental effect on the Optical Signal to Noise Ratio (OSNR) of adjacent super-channels due to interference such as cross-phase modulation. Therefore, it may be highly desirable to be able to evaluate the mutual impact of the existing and new super-channels on each other's quality of transmission (e.g., bit error rate) before establishing new super-channels.

This document defines GMPLS signaling extensions to convey super-channel optical parameters such as number of carriers, each carrier's center frequency, modulation, and FEC type in the RSVP message. This allows nodes along the super-channel path to learn the aforementioned super-channel optical characteristics and in turn advertise this information to other nodes in the network using GMPLS routing extensions defined in [9].

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [RFC2119].

3. GMPLS Signaling Extensions for Super-Channel Optical Parameters

This document defines extensions for signaling super-channel optical parameters including:

- o Number of Carriers
- o Carrier Center Frequency (THz)
- o Carrier Modulation
- o Carrier Baudrate (Gbit/s)
- o Carrier FEC Type

This document defines two options for encoding this information.

[Editor's note: to allow full flexibility we have included two encoding options]

3.1. Option 1: Encode Super-Channel Optical Parameters in the RSVP FLOWSPEC or TSPEC Object

Figure 4: Carrier Modulation sub-sub-TLV.

Figure 5: Carrier FEC sub-sub-TLV.

Where:

- o When the S bit in a TLV is set to 1 it indicates that the TLV contains standardized fields (e.g., Modulation, FEC Type) and when the S bit is set to 0 in a TLV it indicates a vendor specific TLV (see [8])
- o Modulation ID, FEC ID, and I fields are similar to as defined in [8]
- o The Length field in the super-channel Carriers TLV specifies the length in octets of the complete set of TLVs including the set of sub-TLVs that follow.

3.2. Option 2: Encode the Aforementioned Information along with the Super-Channel Label

For example use Super-Channel Label defined in [\[7\]](#) to also encode Super-Channel Carriers TLV, the Carrier sub-TLVs, and the associated set of sub-sub-TLVs defined in the previous section.

4. Procedure for Signaling Super-Channel Optical Parameters

- o The optical parameters of the super-channel are signaled in the RSVP message using encoding option 1 (or option 2).
- o During a new super-channel establishment, each node along the new super-channel setup path allocates the required number of slices and also learns the associated set of signaled super-channel optical parameters.

5. TLV Encoding Examples

To be added later.

6. Security Considerations

<Add any security considerations>

7. IANA Considerations

IANA needs to assign a new Grid field value to represent ITU-T Flex-Grid.
