            Transmission of IPv6 Packets over Near Field Communication
                          draft-ietf-6lo-nfc-02

Abstract

   Near field communication (NFC) is a set of standards for smartphones
   and portable devices to establish radio communication with each other
   by touching them together or bringing them into proximity, usually no
   more than 10 cm. NFC standards cover communications protocols and
   data exchange formats, and are based on existing radio-frequency
   identification (RFID) standards including ISO/IEC 14443 and FeliCa.
   The standards include ISO/IEC 18092 and those defined by the NFC
   Forum. The NFC technology has been widely implemented and available
   in mobile phones, laptop computers, and many other devices. This
   document describes how IPv6 is transmitted over NFC using 6LowPAN
   techniques.

1. Introduction

   NFC is a set of short-range wireless technologies, typically
   requiring a distance of 10 cm or less. NFC operates at 13.56 MHz on
   ISO/IEC 18000-3 air interface and at rates ranging from 106 kbit/s to
   424 kbit/s. NFC always involves an initiator and a target; the
   initiator actively generates an RF field that can power a passive
   target. This enables NFC targets to take very simple form factors
   such as tags, stickers, key fobs, or cards that do not require
   batteries. NFC peer-to-peer communication is possible, provided both
   devices are powered. NFC builds upon RFID systems by allowing two-
   way communication between endpoints, where earlier systems such as
   contactless smart cards were one-way only. It has been used in
   devices such as mobile phones, running Android operating system,
   named with a feature called "Android Beam". In addition, it is
   expected for the other mobile phones, running the other operating
   systems (e.g., iOS, etc.) to be equipped with NFC technology in the
   near future.

   Considering the potential for exponential growth in the number of
   heterogeneous air interface technologies, NFC would be widely used as
   one of the other air interface technologies, such as Bluetooth Low
   Energy (BT-LE), Wi-Fi, and so on. Each of the heterogeneous air
   interface technologies has its own characteristics, which cannot be
   covered by the other technologies, so various kinds of air interface
   technologies would be existing together. Therefore, it is required
   for them to communicate each other. NFC also has the strongest point
   (e.g., secure communication distance of 10 cm) to prevent the third
   party from attacking privacy.

   When the number of devices and things having different air interface
   technologies communicate each other, IPv6 is an ideal internet
   protocols owing to its large address space. Also, NFC would be one
   of the endpoints using IPv6. Therefore, This document describes how
   IPv6 is transmitted over NFC using 6LoWPAN techiques with following
   scopes.

   o Overview of NFC technologies;

   o Specifications for IPv6 over NFC;

      * Neighbor Discovery;

      * Addressing and Configuration;

      * Header Compression;

      * Fragmentation & Reassembly for a IPv6 datagram;

RFC4944 [1] specifies the transmission of IPv6 over IEEE 802.15.4.
The NFC link also has similar characteristics to that of IEEE
802.15.4. Many of the mechanisms defined in the RFC4944 [1] can be
applied to the transmission of IPv6 on NFC links. This document
specifies the details of IPv6 transmission over NFC links.

2. Conventions and Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [2].

3. Overview of Near Field Communication Technology

NFC technology enables simple and safe two-way interactions between
electronic devices, allowing consumers to perform contactless
transactions, access digital content, and connect electronic devices
with a single touch. NFC complements many popular consumer level
wireless technologies, by utilizing the key elements in existing
standards for contactless card technology (ISO/IEC 14443 A&B and
JIS-X 6319-4). NFC can be compatible with existing contactless card
infrastructure and it enables a consumer to utilize one device across
different systems.

Extending the capability of contactless card technology, NFC also
enables devices to share information at a distance that is less than
10 cm with a maximum communication speed of 424 kbps. Users can
share business cards, make transactions, access information from a
smart poster or provide credentials for access control systems with a
simple touch.

NFC's bidirectional communication ability is ideal for establishing
connections with other technologies by the simplicity of touch. In
addition to the easy connection and quick transactions, simple data
sharing is also available.

3.1. Peer-to-peer Mode of NFC

NFC-enabled devices are unique in that they can support three modes
of operation: card emulation, peer-to-peer, and reader/writer. Peer-
to-peer mode enables two NFC-enabled devices to communicate with each
other to exchange information and share files, so that users of NFC-
enabled devices can quickly share contact information and other files
with a touch. Therefore, a NFC-enabled device can securely send IPv6
packets to any corresponding node on the Internet when a NFC-enabled
gateway is linked to the Internet.

3.2. Protocol Stacks of NFC

The IP protocol can use the services provided by Logical Link Control
Protocol (LLCP) in the NFC stack to provide reliable, two-way
transport of information between the peer devices. Figure 1 depicts
the NFC P2P protocol stack with IPv6 bindings to the LLCP.

For data communication in IPv6 over NFC, an IPv6 packet SHALL be
received at LLCP of NFC and transported to an Information Field in
Protocol Data Unit (I PDU) of LLCP of the NFC-enabled peer device.
Since LLCP does not support fragmentation and reassembly, upper
layers SHOULD support fragmentation and reassembly. For IPv6
addressing or address configuration, LLCP SHALL provide related
information, such as link layer addresses, to its upper layer. LLCP
to IPv6 protocol Binding SHALL transfer the SSAP and DSAP value to
the IPv6 over NFC protocol. SSAP stands for Source Service Access
Point, which is 6-bit value meaning a kind of Logical Link Control
(LLC) address, while DSAP means a LLC address of destination NFC-
enabled device.

     +----------------------------------------+ <------------------
```
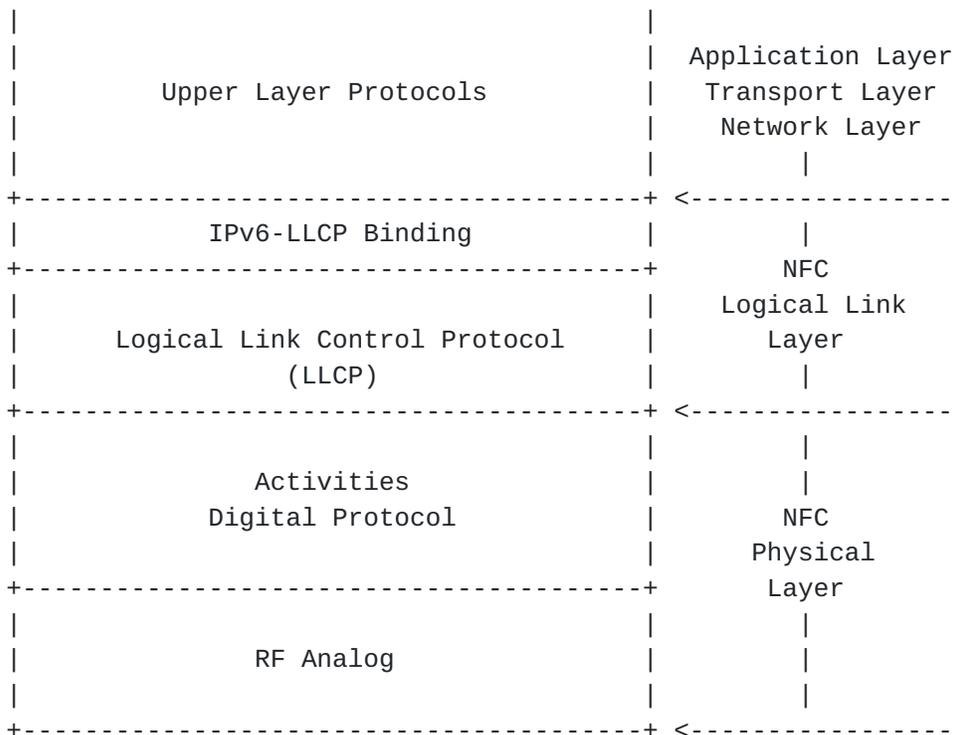

Figure 1: Protocol Stacks of NFC

The LLCP consists of Logical Link Control (LLC) and MAC Mapping. The
MAC Mapping integrates an existing RF protocol into the LLCP
architecture. The LLC contains three components, such as Link
Management, Connection-oriented Transport, and Connection-less

Transport. The Link Management component is responsible for
serializing all connection-oriented and connectionless LLC PDU
(Protocol Data Unit) exchanges and for aggregation and disaggregation
of small PDUs. This component also guarantees asynchronous balanced
mode communication and provides link status supervision by performing
the symmetry procedure. The Connection-oriented Transport component
is responsible for maintaining all connection-oriented data exchanges
including connection set-up and termination. The Connectionless
Transport component is responsible for handling unacknowledged data
exchanges.

3.3. NFC-enabled Device Addressing

NFC-enabled devices are identified by 6-bit LLC address. In other
words, Any address SHALL be usable as both an SSAP and a DSAP
address. According to NFCForum-TS-LLCP_1.1 [3], address values
between 0 and 31 (00h - 1Fh) SHALL be reserved for well-known service
access points for Service Discovery Protocol (SDP). Address values
between 32 and 63 (20h - 3Fh) inclusively, SHALL be assigned by the
local LLC as the result of an upper layer service request.

3.4. NFC MAC PDU Size and MTU

As mentioned in Section 3.2, an IPv6 packet SHALL be received at LLCP
of NFC and transported to an Unnumbered Information Protocol Data
Unit (UI PDU) and an Information Field in Protocol Data Unit (I PDU)
of LLCP of the NFC-enabled peer device. The format of the UI PDU and
I PDU SHALL be as shown in Figure 2 and Figure 3.

```
  0     0   1     1
  0     6   0     6
 +------+----+------+-----------------------------------------+
 |DDDDDD|1100|SSSSSS|           Service Data Unit             |
 +------+----+------+-----------------------------------------+
 | <-- 2 bytes ---> |                                         |
 | <----------------- 128 ~ 2176 bytes -------------------> |
 |                                                           |
```
                Figure 2: Format of the UI PDU in NFC

```
    0     0   1    1   2   2
    0     6   0    6   0   4
   +------+----+------+----+----+-------------------------------+
   |DDDDDD|1100|SSSSSS|N(S)|N(R)|       Service Data Unit        |
   +------+----+------+----+----+-------------------------------+
   | <------- 3 bytes -------->  |                               |
   | <----------------- 128 ~ 2176 bytes -------------------->  |
   |                                                            |
```
                 Figure 3: Format of the I PDU in NFC

The I PDU sequence field SHALL contain two sequence numbers: The send
sequence number N(S) and the receive sequence number N(R). The send
sequence number N(S) SHALL indicate the sequence number associated
with this I PDU. The receive sequence number N(R) value SHALL
indicate that I PDUs numbered up through N(R) - 1 have been received
correctly by the sender of this I PDU and successfully passed to the
senders SAP identified in the SSAP field. These I PDUs SHALL be
considered as acknowledged.

The information field of an I PDU SHALL contain a single service data
unit. The maximum number of octets in the information field SHALL be
determined by the Maximum Information Unit (MIU) for the data link
connection. The default value of the MIU for I PDUs SHALL be 128
octets. The local and remote LLCs each establish and maintain
distinct MIU values for each data link connection endpoint. Also, An
LLC MAY announce a larger MIU for a data link connection by
transmitting an MIUX extension parameter within the information
field. If no MIUX parameter is transmitted, the default MIU value of
128 SHALL be used. Otherwise, the MTU size in NFC LLCP SHALL
calculate the MIU value as follows:

                        MIU = 128 + MIUX.

According to NFCForum-TS-LLCP_1.1 [3], format of the MIUX parameter
TLV is as shown in Figure 4.

```
                0        0      1    2           3
                0        8      6    2           1
               +--------+--------+---------------+
               |  Type  | Length |     Value     |
               +--------+--------+----+----------+
               |00000010|00000010|1011|   MIUX   |
               +--------+--------+----+----------+
                                 | <------> |
                                 0x000 ~ 0x7FF
```
                Figure 4: Format of the MIUX Parameter TLV

When the MIUX parameter is encoded as a TLV, the TLV Type field SHALL
be 0x02 and the TLV Length field SHALL be 0x02. The MIUX parameter
SHALL be encoded into the least significant 11 bits of the TLV Value
field. The unused bits in the TLV Value field SHALL be set to zero
by the sender and SHALL be ignored by the receiver. However, a
maximun value of the TLV Value field can be 0x7FF, and a maximum size
of the MTU in NFC LLCP SHALL calculate 2176 bytes.

4. Specification of IPv6 over NFC

NFC technology sets also has considerations and requirements owing to
low power consumption and allowed protocol overhead. 6LoWPAN
standards RFC4944 [1], RFC6775 [4], and RFC6282 [5] provide useful
functionality for reducing overhead which can be applied to BT-LE.
This functionality comprises of link-local IPv6 addresses and
stateless IPv6 address auto-configuration (see Section 4.3), Neighbor
Discovery (see Section 4.5) and header compression (see Section 4.7).

One of the differences between IEEE 802.15.4 and NFC is that the
former supports both star and mesh topology (and requires a routing
protocol), whereas NFC can support direct peer-to-peer connection and
simple mesh-like topology depending on NFC application scenarios
because of very short RF distance of 10 cm or less.

4.1. Protocol Stacks

Figure 5 illustrates IPv6 over NFC. Upper layer protocols can be
transport protocols (TCP and UDP), application layer, and the others
capable running on the top of IPv6.

```
    |                                          |    Transport &
    |          Upper Layer Protocols           |  Application Layer
    +------------------------------------------+ <------------------
    |                                          |          |
    |                 IPv6                     |          |
    |                                          |       Network
    +------------------------------------------+        Layer
    |    Adaptation Layer for IPv6 over NFC    |          |
    +------------------------------------------+ <------------------
    |           IPv6-LLCP Binding              |          |
    |        Logical Link Control Protocol     |   NFC Link Layer
    |                 (LLCP)                    |          |
    +------------------------------------------+ <------------------
    |                                          |          |
    |               Activities                 |         NFC
    |             Digital Protocol             |   Physical Layer
    |                RF Analog                  |          |
    |                                          |          |
    +------------------------------------------+ <------------------
```

                Figure 5: Protocol Stacks for IPv6 over NFC

   Adaptation layer for IPv6 over NFC SHALL support neighbor discovery,
   address auto-configuration, header compression, and fragmentation &
   reassembly.

4.2. Link Model

   In the case of BT-LE, Logical Link Control and Adaptation Protocol
   (L2CAP) supports fragmentation and reassembly (FAR) functionality;
   therefore, adaptation layer for IPv6 over BT-LE does not have to
   conduct the FAR procedure. The NFC LLCP, by contrast, does not
   support the FAR functionality, so IPv6 over NFC needs to consider the
   FAR functionality, defined in RFC4944 [1]. However, MTU on NFC link
   can be configured in a connection procedure and extended enough to
   fit the MTU of IPv6 packet.

   The NFC link between two communicating devices is considered to be a
   point-to-point link only. Unlike in BT-LE, NFC link does not
   consider star topology and mesh network topology but peer-to-peer
   topology and simple multi-hop topology. Due to this characteristics,
   6LoWPAN functionality, such as addressing and auto-configuration, and
   header compression, is specialized into NFC.

4.3. Stateless Address Autoconfiguration

A NFC-enabled device (i.e., 6LN) performs stateless address
autoconfiguration as per RFC4862 [6]. A 64-bit Interface identifier
(IID) for a NFC interface MAY be formed by utilizing the 6-bit NFC
LLCP address (i.e., SSAP or DSAP) (see Section 3.3). In the
viewpoint of address configuration, such an IID MAY guarantee a
stable IPv6 address because each data link connection is uniquely
identified by the pair of DSAP and SSAP included in the header of
each LLC PDU in NFC.

Following the guidance of RFC7136 [10], interface Identifiers of all
unicast addresses for NFC-enabled devices are formed on the basis of
64 bits long and constructed in a modified EUI-64 format as shown in
Figure 6.

```
0                 1               3               4           5     6
0                 6               2               8           8     3
+----------------+----------------+----------------+----------+------+
|0000000000000000|0000000011111111|1111111000000000|0000000000| SSAP |
+----------------+----------------+----------------+----------+------+
```

         Figure 6: Formation of IID from NFC-enabled device adddress

In addition, the "Universal/Local" bit in the case of NFC-enabled
device address MUST be set to 0 RFC4291 [7].

4.4. IPv6 Link Local Address

Only if the NFC-enabled device address is known to be a public
address the "Universal/Local" bit can be set to 1. The IPv6 link-
local address for a NFC-enabled device is formed by appending the
IID, to the prefix FE80::/64, as depicted in Figure 7.

```
    0         0               0                           1
    0         1               6                           2
    0         0               4                           7
  +----------+-----------------+---------------------------+
  |1111111010|      zeros      |    Interface Identifier   |
  +----------+-----------------+---------------------------+
  |                                                        |
  | <-------------------- 128 bits --------------------> |
  |                                                        |
```
            Figure 7: IPv6 link-local address in NFC

The tool for a 6LBR to obtain an IPv6 prefix for numbering the NFC
network is can be accomplished via DHCPv6 Prefix Delegation (RFC3633
[8]).

4.5. Neighbor Discovery

Neighbor Discovery Optimization for 6LoWPANs (RFC6775 [4]) describes
the neighbor discovery approach in several 6LoWPAN topologies, such
as mesh topology. NFC does not consider complicated mesh topology
but simple multi-hop network topology or directly connected peer-to-
peer network. Therefore, the following aspects of RFC6775 are
applicable to NFC:

1. In a case that a NFC-enabled device (6LN) is directly connected
    to 6LBR, A NFC 6LN MUST register its address with the 6LBR by
    sending a Neighbor Solicitation (NS) message with the Address
    Registration Option (ARO) and process the Neighbor Advertisement
    (NA) accordingly. In addition, DHCPv6 is used to assigned an
    address, Duplicate Address Detection (DAD) is not required.

2. For sending Router Solicitations and processing Router
    Advertisements the NFC 6LNs MUST follow Sections 5.3 and 5.4 of
    the RFC6775.

4.6. Dispatch Header

All IPv6-over-NFC encapsulated datagrams transmitted over NFC are
prefixed by an encapsulation header stack consisting of a Dispatch
value followed by zero or more header fields. The only sequence
currently defined for IPv6-over-NFC is the LOWPAN_IPHC header
followed by payload, as depicted in Figure 8.

```
        +---------------+---------------+--------------+
        | IPHC Dispatch |  IPHC Header  |    Payload   |
        +---------------+---------------+--------------+
```
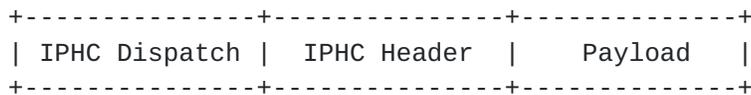

Figure 8: A IPv6-over-NFC Encapsulated 6LOWPAN_IPHC Compressed IPv6
                            Datagram

The dispatch value may be treated as an unstructured namespace. Only
a single pattern is used to represent current LoBAC functionality.

```
         +------------+--------------------+----------+
         |  Pattern   | Header Type        | Reference |
         +------------+--------------------+----------+
         | 01  1xxxxx | 6LOWPAN_IPHC       | [RFC6282] |
         +------------+--------------------+----------+
```

Figure 9: Dispatch Values

Other IANA-assigned 6LoWPAN Dispatch values do not apply to this
specification.

4.7. Header Compression

Header compression as defined in RFC6282 [5] , which specifies the
compression format for IPv6 datagrams on top of IEEE 802.15.4, is
REQUIRED in this document as the basis for IPv6 header compression on
top of NFC. All headers MUST be compressed according to RFC6282
encoding formats.

Therefore, IPv6 header compression in RFC6282 [5] MUST be
implemented. Further, implementations MAY also support Generic
Header Compression (GHC) of RFC7400 [11]. A node implementing GHC
MUST probe its peers for GHC support before applying GHC.

If a 16-bit address is required as a short address of IEEE 802.15.4,
it MUST be formed by padding the 6-bit NFC link-layer (node) address
to the left with zeros as shown in Figure 10.

```
              0                   1
              0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
             +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
             | Padding(all zeros)| NFC Addr. |
             +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

Figure 10: NFC short adress format

4.8. Fragmentation and Reassembly

NFC provides fragmentation and reassembly (FAR) for payloads from 128
bytes up to 2176 bytes as mention in Section 3.4. The MTU of a
general IPv6 packet can fit into a sigle NFC link frame. Therefore,
the FAR functionality as defined in RFC4944, which specifies the
fragmentation methods for IPv6 datagrams on top of IEEE 802.15.4, is
NOT REQUIRED in this document as the basis for IPv6 datagram FAR on
top of NFC. The NFC link connection for IPv6 over NFC MUST be
configured with an equivalent MIU size to fit the MTU of IPv6 Packet.
However, the default configuration of MIUX value is 0x480 in order to
fit the MTU (1280 bytes) of a IPv6 packet.

4.9. Unicast Address Mapping

   The address resolution procedure for mapping IPv6 non-multicast
   addresses into NFC link-layer addresses follows the general
   description in Section 7.2 of RFC4861 [9], unless otherwise
   specified.

   The Source/Target link-layer Address option has the following form
   when the addresses are 6-bit NFC link-layer (node) addresses.

```
                    0                   1
                    0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
                   +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
                   |     Type      |   Length=1    |
                   +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
                   |                               |
                   +-     Padding (all zeros)     -+
                   |                               |
                   +-                 +-+-+-+-+-+-+
                   |                   | NFC Addr. |
                   +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

                   Figure 11: Unicast address mapping

   Option fields:

      Type:

         1: for Source Link-layer address.

         2: for Target Link-layer address.

      Length:

         This is the length of this option (including the type and
         length fields) in units of 8 octets. The value of this field
         is 1 for 6-bit NFC node addresses.

      NFC address:

         The 6-bit address in canonical bit order. This is the unicast
         address the interface currently responds to.

4.10. Multicast Address Mapping

   All IPv6 multicast packets MUST be sent to NFC Destination Address,
   0x3F (broadcast) and filtered at the IPv6 layer. When represented as
   a 16-bit address in a compressed header, it MUST be formed by padding

on the left with a zero. In addition, the NFC Destination Address,
0x3F, MUST not be used as a unicast NFC address of SSAP or DSAP.

```
                        0                   1
                        0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5
                       +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
                       | Padding(all zeros)|1 1 1 1 1 1|
                       +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

                   Figure 12: Multicast address mapping

5. Internet Connectivity Scenarios

As two typical scenarios, the NFC network can be isolated and
connected to the Internet.

5.1. NFC-enabled Device Connected to the Internet

One of the key applications by using adaptation technology of IPv6
over NFC is the most securely transmitting IPv6 packets because RF
distance between 6LN and 6LBR SHOULD be within 10 cm. If any third
party wants to hack into the RF between them, it MUST come to nearly
touch them. Applications can choose which kinds of air interfaces
(e.g., BT-LE, Wi-Fi, NFC, etc.) to send data depending
characteristics of data. NFC SHALL be the best solution for secured
and private information.

Figure 13 illustrates an example of NFC-enabled device network
connected to the Internet. Distance between 6LN and 6LBR SHOULD be
10 cm or less. If there is any of close laptop computers to a user,
it SHALL becomes the 6LBR. Additionally, When the user mounts a NFC-
enabled air interface adapter (e.g., portable small NFC dongle) on
the close laptop PC, the user's NFC-enabled device (6LN) can
communicate the laptop PC (6LBR) within 10 cm distance.

```
                               ************
        6LN ------------------- 6LBR -----* Internet *------- CN
         |  (dis. 10 cm or less)  |       ************          |
         |                        |                             |
         | <-------- NFC -------> | <----- IPv6 packet ------> |
         | (IPv6 over NFC packet) |                             |
```

     Figure 13: NFC-enabled device network connected to the Internet

5.2. Isolated NFC-enabled Device Network

In some scenarios, the NFC-enabled device network may transiently be
a simple isolated network as shown in the Figure 14.

```
      6LN --------------------- 6LR --------------------- 6LN
       |     (10 cm or less)     |     (10 cm or less)      |
       |                         |                          |
       | <--------- NFC -------> | <--------- NFC -------> |
       |   (IPv6 over NFC packet) |  (IPv6 over NFC packet)  |
```
            Figure 14: Isolated NFC-enabled device network

In mobile phone markets, applications are designed and made by user
developers. They may image interesting applications, where three or
more mobile phones touch or attach each other to accomplish
outstanding performance. For instance, three or more mobile phones
can play multi-channel sound of music together. In addition,
attached three or more mobile phones can make an extended banner to
show longer sentences in a concert hall.

6. IANA Considerations

There are no IANA considerations related to this document.

7. Security Considerations

The method of deriving Interface Identifiers from 6-bit NFC Link
layer addresses is intended to preserve global uniqueness when it is
possible. Therefore, it is to required to protect from duplication
through accident or forgery.

8. Acknowledgements
