                                                          June 25, 2018

                      **EST over secure CoAP (EST-coaps)**
                        **draft-ietf-ace-coap-est-03**

Abstract

   Enrollment over Secure Transport (EST) is used as a certificate
   provisioning protocol over HTTPS.  Low-resource devices often use the
   lightweight Constrained Application Protocol (CoAP) for message
   exchanges.  This document defines how to transport EST payloads over
   secure CoAP (EST-coaps), which allows low-resource constrained
   devices to use existing EST functionality for provisioning
   certificates.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF).  Note that other groups may also distribute
   working documents as Internet-Drafts.  The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months
   and may be updated, replaced, or obsoleted by other documents at any
   time.  It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on December 27, 2018.

Table of Contents

## 1.  Introduction

   "Classical" Enrollment over Secure Transport (EST) [RFC7030] is used
   for authenticated/authorized endpoint certificate enrollment (and
   optionally key provisioning) through a Certificate Authority (CA) or
   Registration Authority (RA).  EST messages run over HTTPS.

   This document defines a new transport for EST based on the
   Constrained Application Protocol (CoAP) since some Internet of Things
   (IoT) devices use CoAP instead of HTTP.  Therefore, this
   specification utilizes DTLS [RFC6347], CoAP [RFC7252], and UDP
   instead of TLS [RFC5246], HTTP [RFC7230] and TCP.

   EST messages may be relatively large and for this reason this
   document also uses CoAP Block-Wise Transfer [RFC7959] to offer a
   fragmentation mechanism of EST messages at the CoAP layer.

   This specification also profiles the use of EST to only support
   certificate-based client Authentication.  HTTP Basic or Digest
   authentication (as described in Section 3.2.3 of [RFC7030] are not
   supported.

## 2.  Terminology

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
   document are to be interpreted as described in [RFC2119].

   Many of the concepts in this document are taken over from [RFC7030].
   Consequently, much text is directly traceable to [RFC7030].  The same
   document structure is followed to point out the differences and
   commonalities between EST and EST-coaps.

## 3.  Conformance to RFC7925 profiles

   This section shows how EST-coaps fits into the profiles of low-
   resource devices described in [RFC7925].

   EST-coaps can transport certificates and private keys.  Certificates
   are responses to (re-)enrollment requests or request for a trusted
   certificate list.  Private keys can be transported as responses to a

request to a server-side keygeneration as described in section 4.4 of
[RFC7030] and discussed in Section 4.5 of this document.

As per [RFC7925] section 3.3 and section 4.4, the mandatory cipher
suite for DTLS in EST-coaps is TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8
defined in [RFC7251], and the curve secp256r1 MUST be supported
[RFC4492]; this curve is equivalent to the NIST P-256 curve.  Crypto
agility is important, and the recommendations in [RFC7925] section
4.4 and any updates to RFC7925 concerning Curve25519 and other CFRG
curves also applies.

DTLS1.2 implementations MUST use the Supported Elliptic Curves and
Supported Point Formats Extensions [RFC4492].  Uncompressed point
format MUST also be supported.  [RFC6090] can be used as summary of
the ECC algorithms.  DTLS 1.3 implementations differ from DTLS 1.2
because they do not support point format negotiation in favor of a
single point format for each curve and thus support for DTLS 1.3 does
not mandate point formation extensions and negotiation.

The EST-coaps client MUST be configured with at least an implicit TA
database from its manufacturer.  The authentication of the EST-coaps
server by the EST-coaps client is based on certificate authentication
in the DTLS handshake.

The authentication of the EST-coaps client is based on a client
certificate in the DTLS handshake.  This can either be

o  a previously issued client certificate (e.g., an existing
   certificate issued by the EST CA); this could be a common case for
   simple re-enrollment of clients;

o  a previously installed certificate (e.g., manufacturer-installed
   certificate or a certificate issued by some other party); the
   server is expected to trust the manufacturer's root CA certificate
   in this case.

4.  Protocol Design

EST-coaps uses CoAP to transfer EST messages, aided by Block-Wise
Transfer [RFC7959] to transport CoAP messages in blocks thus avoiding
(excessive) fragmentation of UDP datagrams.  The use of "Block" for
the transfer of larger EST messages is specified in Section 4.6.  The
Figure 1 below shows the layered EST-coaps architecture.

```
+--------------------------------------------------+
|     EST request/response messages                |
+--------------------------------------------------+
|     CoAP for message transfer and signalling     |
+--------------------------------------------------+
|     DTLS for transport security                  |
+--------------------------------------------------+
|     UDP for transport                            |
+--------------------------------------------------+
```
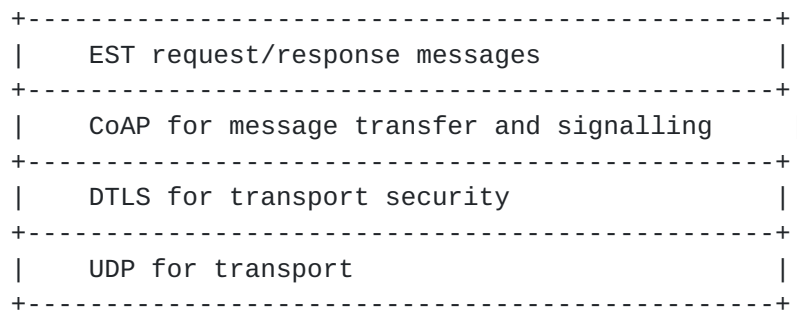

Figure 1: EST-coaps protocol layers

The EST-coaps protocol design follows closely the EST design.  The
actions supported by EST-coaps are identified by their message types:

o  CA certificate retrieval, needed to receive the complete set of CA
   certificates.

o  Simple enroll and reenroll, for CA to sign public client-identity
   key.

o  Certificate Signing Request (CSR) Attributes request messages,
   informs the client of the fields to include in generated CSR.

o  Server-side key generation messages, to provide a private client-
   identity key when the client choses for an external entity to
   generate its private key.

## 4.1.  Payload format

The content-format (media type equivalent) of the CoAP message
determines which EST message is transported in the CoAP payload.  The
media types specified in the HTTP Content-Type header (section 3.2.2
of [RFC7030]) are in EST-coaps specified by the Content-Format Option
(12) of CoAP.  The combination of URI path and content-format used
for CoAP MUST map to an allowed combination of URI and media type as
defined for EST.  The required content-formats for these requests and
response messages are defined in Section 9.  The CoAP response codes
are defined in Section 4.3.

EST-coaps is designed for use between low-resource devices and hence
does not need to send base64-encoded data.  Simple binary is more
efficient (30% smaller payload) and well supported by CoAP.
Therefore, the content formats specification in Section 4.1.1
specifies that the binary payload is transported as a CBOR major type
2, a byte string, for all EST-coaps Content-Formats.  In the examples
of Appendix A, the base16 diagnostic notation is used for CBOR major
type 2, where h'450aafbb' represents an example binary payload.

### 4.1.1.  Content Format application/multipart-core

   A representation with content format ID TBD8 contains a collection of
   representations along with their respective content format.  The
   content-format identifies the media-type application/multipart-core
   specified in [I-D.fossati-core-multipart-ct].

   The collection is encoded as a CBOR array [RFC7049] with an even
   number of elements.  The second, fourth, sixth, etc. element is a
   binary string containing a representation.  The first, third, fifth,
   etc. element is an unsigned integer specifying the content format ID
   of the following representation.

   For example, a collection containing two representations, one with
   content format ID TBD5 and one with content format ID TBD2, looks
   like this in diagnostic CBOR notation:
   [TBD5,h'0123456789abcdef',TBD2,h'fedcba9876543210'].  An example is
   shown in Appendix A.4.

### 4.2.  Message Bindings

   The general EST CoAP message characteristics are:

   o  All EST-coaps messages expect a response from the server, thus the
      client MUST send the requests over confirmable CON COAP messages.

   o  The Ver, TKL, Token, and Message ID values of the CoAP header are
      not affected by EST.

   o  The CoAP options used are Uri-Host, Uri-Path, Uri-Port, Content-
      Format, and Location-Path in CoAP.  These CoAP Options are used to
      communicate the HTTP fields specified in the EST REST messages.

   o  EST URLs are HTTPS based (https://), in CoAP these will be assumed
      to be transformed to coaps (coaps://)

   Appendix A includes some practical examples of EST messages
   translated to CoAP.

### 4.3.  CoAP response codes

   Section 5.9 of [RFC7252] specifies the mapping of HTTP response codes
   to CoAP response codes.  Every time the HTTP response code 200 is
   specified in [RFC7030] in response to a GET request, in EST-coaps the
   equivalent CoAP response code 2.05 or 2.03 MUST be used.  Similarly,
   2.01, 2.02 or 2.04 MUST be used in response to POST EST requests.
   Response code HTTP 202 has no equivalent in CoAP.  In Section 4.4 it
   is specified how EST requests over CoAP handle delayed messages.

All other HTTP 2xx response codes are not used by EST.  For the
following HTTP 4xx error codes that may occur: 400, 401, 403, 404,
405, 406, 412, 413, 415; the equivalent CoAP response code for EST-
coaps is 4.xx.  For the HTTP 5xx error codes: 500, 501, 502, 503, 504
the equivalent CoAP response code is 5.xx.

## 4.4.  Delayed Results

Using the enroll request with CSR reponse, examples ae shown for a
server without delay, a short delay and a long delay.

When the server can respond immediately, and multiple blocks need to
be sent, Appendix B.2 shows the corresponding exchange of blocks.

According to section 5.2.2 of [RFC7252], a slow server can
acknowledge the request and respond later with the requested resource
representation.

In particular, A slow server can respond to a CSR request with an
empty ACK with code 0.00, before sending the certificate to the
server after a short delay.  Consecutively, the server will need more
than one "Block2" blocks to respond.  This situation is shown in
Figure 2 where a client sends an enrollment request that uses more
than one "Block1" blocks.  The server uses an empty 0.00 ACK to
announce the response which will be provided later with 2.04 messages
containing "Block2" options.  Having received the first 128 bytes in
the first "block2" block, the client asks for a block reduction to
128 bytes in all following "block2" blocks, starting with the second
block (NUM=1).

```
POST [2001:db8::2:1]:61616/est/sen (CON)(1:0/1/256) {CSR req} -->
        <-- (ACK) (1:0/1/256) (2.31 Continue)
POST [2001:db8::2:1]:61616/est/sen (CON)(1:1/1/256) {CSR req} -->
        <-- (ACK) (1:1/1/256) (2.31 Continue)
                            .
                            .
                            .
POST [2001:db8::2:1]:61616/est/sen (CON)(1:N1/0/256){CSR req} -->
        <-- (0.00 empty ACK)
                           |
        ...... short delay before certificate is ready.......
                           |
      <-- (CON) (1:N1/0/256)(2:0/1/256)(2.04 Changed) {Cert resp}
           (ACK)                                              -->
POST [2001:db8::2:1]:61616/est/sen (CON)(2:1/0/128)          -->
        <-- (ACK) (2:1/1/128) (2.04 Changed) {Cert resp}
                            .
                            .
                            .
POST [2001:db8::2:1]:61616/est/sen (CON)(2:N2/0/128)         -->
        <-- (ACK) (2:N2/0/128) (2.04 Changed) {Cert resp}
```

             Figure 2: EST-COAP enrolment with short wait

If the server is very slow providing the response (say minutes,
possible when a manual intervention is wanted), the server SHOULD
respond with an empty ACK containing response code 5.03 (Service
unavailable) and a Max-Age option to indicate the time the client
SHOULD wait to request the content later.

In particular, when the server is not ready to return the certificate
after an enrolment request, the server responds with response code
5.03 (Service Unavailable) including the Max-Age option.  After a
delay of Max-Age, the client SHOULD send the identical CSR to the
server.  As long as the server responds with response code 5.03
(Service Unavailable), the client can resend the enrolment request
until the server responds with the certificate or the client abandons
for other reasons.

To demonstrate this situation, Figure 3 shows a client sending an
enrolment request that will use more than one "Block1" block to send
the CSR to the server.  The server needs more than one "Block2"
blocks to respond, but also needs to take a long delay (minutes) to
provide the response.  Consequently, the server will use a 5.03 ACK
for the response.  The client can be requested to wait multiple times
for a period of Max-Age. Note that in the example below the server
asks for a decrease in the block size when acknowledging the first
Block2.

Figure 5 can be compared with Figure 3 to see the extra requests
after a Max-Age wait.

```
POST [2001:db8::2:1]:61616/est/sen (CON)(1:0/1/256) {CSR req} -->
     <-- (ACK) (1:0/1/256) (2.31 Continue)
POST [2001:db8::2:1]:61616/est/sen (CON)(1:1/1/256) {CSR req} -->
     <-- (ACK) (1:1/1/256) (2.31 Continue)
                    .
                    .
POST [2001:db8::2:1]:61616/est/sen (CON)(1:N1/0/256){CSR req} -->
    <-- (ACK) (1:N1/0/256) (2:0/0/128) (5.03 Service Unavailable)
                                                  (Max-Age)
                    |
                    |
Client tries one or more times after Max-Age with identical payload
                    |
                    |
POST [2001:db8::2:1]:61616/est/sen (CON)(1:N1/0/256){CSR req} -->
    <-- (ACK) (1:N1/0/256) (2:0/1/128) (2.04 Changed){Cert resp}
POST [2001:db8::2:1]:61616/est/sen (CON)(2:1/0/128)           -->
    <-- (ACK) (2:1/1/128) (2.04 Changed) {Cert resp}
                    .
                    .
                    .

## 4.5.  Server-side Key Generation

Constrained devices sometimes do not have the necessary hardware to
generate statistically random numbers for private keys and DTLS
ephemeral keys.  Past experience has shown that low-resource
endpoints sometimes generate numbers which could allow someone to
decrypt the communication or guess the private key and impersonate as
the device.  Studies have shown that the same keys are generated by
the same model devices deployed on-line.

Additionally, random number key generation is costly, thus energy
draining.  Even though the random numbers that constitute the
identity/cert do not get generated often, an endpoint may not want to
spend time and energy generating keypairs, and just ask for one from
the server.

In these scenarios, server-side key generation can be used.  The
client asks for the server or proxy to generate the private key and
the certificate which is transferred back to the client in the
server-side key generation response.

[RFC7030] recommends for the private key returned by the server to be
encrypted.  The specification provides two methods to encrypt the
generated key, symmetric and asymmetric.  The methods are signalled
by the client by using the relevant attributes (SMIMECapabilities and
DecryptKeyIdentifier or AsymmetricDecryptKeyIdentifier) in the CSR
request.  In the symmetric key case, the key can be established out-
of-band or alternatively derived by the established TLS connection as
described in [RFC5705].

The sever-side key generation response is returned using a CBOR array
Section 4.1.1.  The certificate part exactly matches the response
from a enrollment response.  The private key is placed inside of a
CMS SignedData.  The SignedData is signed by the party that generated
the private key, which may or may not be the EST server or the EST
CA.  The SignedData is further protected by placing it inside of a
CMS EnvelopedData as explained in Section 4.4.2 of [RFC7030].

## 4.6.  Message fragmentation

DTLS defines fragmentation only for the handshake part and not for
secure data exchange (DTLS records).  [RFC6347] states that to avoid
using IP fragmentation, which involves error-prone datagram
reconstitution, invokers of the DTLS record layer SHOULD size DTLS
records so that they fit within any Path MTU estimates obtained from
the record layer.  In addition, invokers residing on a 6LoWPAN over
IEEE 802.15.4 network SHOULD attempt to size CoAP messages such that
each DTLS record will fit within one or two IEEE 802.15.4 frames.

That is not always possible.  Even though ECC certificates are small
in size, they can vary greatly based on signature algorithms, key
sizes, and OID fields used.  For 256-bit curves, common ECDSA cert
sizes are 500-1000 bytes which could fluctuate further based on the
algorithms, OIDs, SANs and cert fields.  For 384-bit curves, ECDSA
certs increase in size and can sometimes reach 1.5KB.  Additionally,
there are times when the EST cacerts response from the server can
include multiple certs that amount to large payloads.  Section 4.6 of
CoAP [RFC7252] describes the possible payload sizes: "if nothing is
known about the size of the headers, good upper bounds are 1152 bytes
for the message size and 1024 bytes for the payload size".
Section 4.6 of [RFC7252] also suggests that IPv4 implementations may
want to limit themselves to more conservative IPv4 datagram sizes
such as 576 bytes.  From [RFC0791] follows that the absolute minimum
value of the IP MTU for IPv4 is as low as 68 bytes, which would leave

only 40 bytes minus security overhead for a UDP payload.  Thus, even
with ECC certs, EST-coaps messages can still exceed sizes in MTU of
1280 for IPv6 or 60-80 bytes for 6LoWPAN [RFC4919] as explained in
section 2 of [RFC7959].  EST-coaps needs to be able to fragment EST
messages into multiple DTLS datagrams.  Fine-grained fragmentation of
EST messages is essential.

To perform fragmentation in CoAP, [RFC7959] specifies the "Block1"
option for fragmentation of the request payload and the "Block2"
option for fragmentation of the return payload of a CoAP flow.

The BLOCK draft defines SZX in the Block1 and Block2 option fields.
These are used to convey the size of the blocks in the requests or
responses.

The CoAP client MAY specify the Block1 size and MAY also specify the
Block2 size.  The CoAP server MAY specify the Block2 size, but not
the Block1 size.  As explained in Section 1 of [RFC7959]), blockwise
transfers SHOULD be used in Confirmable CoAP messages to avoid the
exacerbation of lost blocks.

The Size1 response MAY be parsed by the client as a size indication
of the Block2 resource in the server response or by the server as a
request for a size estimate by the client.  Similarly, Size2 option
defined in BLOCK should be parsed by the server as an indication of
the size of the resource carried in Block1 options and by the client
as a maximum size expected in the 4.13 (Request Entity Too Large)
response to a request.

Examples of fragmented messages are shown in Appendix B.

## 4.7.  Deployment limits

Although EST-coaps paves the way for the utilization of EST for
constrained devices on constrained networks, some devices will not
have enough resources to handle the large payloads that come with
EST-coaps.  The specification of EST-coaps is intended to ensure that
EST works for networks of constrained devices that choose to limit
their communications stack to UDP/CoAP.  It is up to the network
designer to decide which devices execute the EST protocol and which
do not.

## 5.  Discovery and URI

EST-coaps is targeted to low-resource networks with small packets.
Saving header space is important and an additional EST-coaps URI is
specified that is shorter than the EST URI.

   In the context of CoAP, the presence and location of (path to) the
   management data are discovered by sending a GET request to "/.well-
   known/core" including a resource type (RT) parameter with the value
   "ace.est" [RFC6690].  Upon success, the return payload will contain
   the root resource of the EST resources.  It is up to the
   implementation to choose its root resource; throughout this document
   the example root resource /est is used.

   The individual EST-coaps server URIs differ from the EST URI by
   replacing the scheme https by coaps and by specifying shorter
   resource path names:

   coaps://www.example.com/.well-known/est/ArbitraryLabel/<short-est>.

   The ArbitraryLabel Path-Segment SHOULD be of the shortest length
   possible.

   Figure 5 in section 3.2.2 of [RFC7030] enumerates the operations and
   corresponding paths which are supported by EST.  Table 1 provides the
   mapping from the EST URI path to the shorter EST-coaps URI path.

```
           +------------------+-----------+
           | EST              | EST-coaps |
           +------------------+-----------+
           | /cacerts         | /crts     |
           | /simpleenroll    | /sen      |
           | /simplereenroll  | /sren     |
           | /csrattrs        | /att      |
           | /serverkeygen    | /skg      |
           +------------------+-----------+
```

                              Table 1

   The short resource URIs MUST be supported.  The corresponding longer
   URIs specified in [RFC7030] MAY be supported.

   When discovering the root path for the EST resources, the server MAY
   return all available resource paths and the used content types.  This
   is useful when multiple content types are specified for EST-coaps
   server.  The example below shows the discovery of the presence and
   location of management data.

```
   REQ: GET /.well-known/core?rt=ace.est

   RES: 2.05 Content
 </est>; rt="ace.est"
 </est/crts>;ct=TBD2
 </est/sen>;ct=TBD2 TBD7
 </est/sren>;ct=TBD2 TBD7
 </est/att>;ct=TBD6
 </est/skg>;ct=TBD1 TBD7 TBD8
```

The first line of the discovery response MUST be returned.  The five
consecutive lines MAY be returned.  The return of the content-types
in the last four lines allows the client to choose the most
appropriate one from multiple content types.

## 6.  DTLS Transport Protocol

EST-coaps depends on a secure transport mechanism over UDP that can
secure (confidentiality, authenticity) the exchanged CoAP messages.

DTLS is one such secure protocol.  When "TLS" is referred to in the
context of EST, it is understood that in EST-coaps, security is
provided using DTLS instead.  No other changes are necessary (all
provisional modes etc. are the same as for TLS).

CoAP was designed to avoid fragmentation.  DTLS is used to secure
CoAP messages.  However, fragmentation is still possible at the DTLS
layer during the DTLS handshake when using ECC ciphersuites.  If
fragmentation is necessary, "DTLS provides a mechanism for
fragmenting a handshake message over several records, each of which
can be transmitted separately, thus avoiding IP fragmentation"
[RFC6347].

CoAP and DTLS can provide proof of identity for EST-coaps clients and
server with simple PKI messages conformant to section 3.1 of
[RFC5272].  EST-coaps supports the certificate types and Trust
Anchors (TA) that are specified for EST in section 3 of [RFC7030].

Channel-binding information for linking proof-of-identity with
connection-based proof-of-possession is optional for EST-coaps.  When
proof-of-possession is desired, a set of actions are required
regarding the use of tls-unique, described in section 3.5 in
[RFC7030].  The tls-unique information translates to the contents of
the first "Finished" message in the (D)TLS handshake between server
and client [RFC5929].  The client is then supposed to add this
"Finished" message as a ChallengePassword in the attributes section
of the PKCS#10 Request Info to prove that the client is indeed in
control of the private key at the time of the TLS session when

performing a /simpleenroll, for example.  In the case of EST-coaps,
the same operations can be performed during the DTLS handshake.  For
DTLS 1.2, in the event of handshake message fragmentation, the Hash
of the handshake messages used in the MAC calculation of the Finished
message

PRF(master_secret, finished_label, Hash(handshake_messages))
    [0..verify_data_length-1];

MUST be computed as if each handshake message had been sent as a
single fragment [RFC6347].  Similarly, for DTLS 1.3, the Finished
message

HMAC(finished_key,
    Transcript-Hash(Handshake Context,
    Certificate*, CertificateVerify*))

    * Only included if present.

MUST be computed as if each handshake message had been sent as a
single fragment following the algorithm described in 4.4.4 of
[I-D.ietf-tls-tls13].

In a constrained CoAP environment, endpoints can't afford to
establish a DTLS connection for every EST transaction.
Authenticating and negotiating DTLS keys requires resources on low-
end endpoints and consumes valuable bandwidth.  The DTLS connection
SHOULD remain open for persistent EST connections.  For example, an
EST cacerts request that is followed by a simpleenroll request can
use the same authenticated DTLS connection.  Given that after a
successful enrollment, it is more likely that a new EST transaction
will take place after a significant amount of time, the DTLS
connections SHOULD only be kept alive for EST messages that are
relatively close to each other.  In some cases, such as NAT
rebinding, keeping the state of a connection is not possible when
devices sleep for extended periods of time.  In such occasions,
[I-D.rescorla-tls-dtls-connection-id] negotiates a connection ID that
can eliminate the need for new handshake and its additional cost.

## 7.  HTTPS-CoAPS Registrar

In real-world deployments, the EST server will not always reside
within the CoAP boundary.  The EST-server can exist outside the
constrained network in a non-constrained network that supports TLS/
HTTP.  In such environments EST-coaps is used by the client within
the CoAP boundary and TLS is used to transport the EST messages
outside the CoAP boundary.  A Registrar at the edge is required to
operate between the CoAP environment and the external HTTP network.

   The EST coaps-to-HTTPS Registrar MUST terminate EST-coaps and
   authenticate the client downstream and initiate EST connections over
   TLS upstream.

   The Registrar SHOULD authenticate the client downstream and it should
   be authenticated by the EST server or CA upstream.  The Registration
   Authority (re-)creates the secure connection from DTLS to TLS and
   vice versa.  A trust relationship SHOULD be pre-established between
   the Registrar and the EST servers to be able to proxy these
   connections on behalf of various clients.

   When enforcing Proof-of-Possession (POP), the (D)TLS tls-unique value
   of the (D)TLS session needs to be used to prove that the private key
   corresponding to the public key is in the possession of and can be
   used by an end-entity or client.  In other words, the CSR the client
   is using needs to include information from the DTLS connection the
   client establishes with the server.  In EST, that information is the
   (D)TLS tls-unique value of the (D)TLS session.  In the presence of
   ESTcoaps-to-HTTPS Registrar, the EST-coaps client MUST be
   authenticated and authorized by the Registrar and the Registrar MUST
   be authenticated as an EST Registrar client to the EST server.  Thus
   the POP information is lost between the EST-coaps client and the EST
   server.  The EST server becomes aware of the presence of an EST
   Registrar from its TLS client certificate that includes id-kp-cmcRA
   [RFC6402] extended key usage extension.  As explained in Section 3.7
   of [RFC7030], the EST server SHOULD apply an authorization policy
   consistent with a Registrar client.  For example, it could be
   configured to accept POP linking information that does not match the
   current TLS session because the authenticated EST client Registrar
   has verified this information when acting as an EST server.

   One possible use-case, shown in one figure below, is expected to be
   deployed in practice:

```
                            Constrained Network
                      .---------.   .----------------------------.
                      |   CA    |   |.--------------------------.|
                      '---------'   ||                          ||
                           |        ||                          ||
   .-------.  HTTP  .----------------.  CoAPS  .-----------.  ||
   | EST  |<------->|ESTcoaps-to-HTTPS|<-------->| EST Client|  ||
   |Server|over TLS |   Registrar    |         '-----------'  ||
   '------'         '----------------'                         ||
                      ||                                       ||
                      |'--------------------------'|
                      '----------------------------'
```

            ESTcoaps-to-HTTPS Registrar at the CoAP boundary.

Table 1 contains the URI mapping between the EST-coaps and EST the Registrar SHOULD adhere to.  Section 7 of [RFC8075] and Section 4.3 define the mapping between EST-coaps and HTTP response codes, that determines how the Registrar translates CoAP response codes from/to HTTP status codes.  The mapping from Content-Type to media type is defined in Section 9.  The conversion from CBOR major type 2 to base64 encoding needs to be done in the Registrar.  Conversion is possible because a TLS link exists between EST-coaps-to-HTTP Registrar and EST server and a corresponding DTLS link exists between EST-coaps-to-HTTP Registrar and EST client.

Due to fragmentation of large messages into blocks, an EST-coaps-to-HTTP Registrar SHOULD reassemble the BLOCKs before translating the binary content to Base-64, and consecutively relay the message upstream.

For the discovery of the EST server by the EST client in the coap environment, the EST-coaps-to-HTTP Registrar MUST announce itself according to the rules of Section 5.  The available actions of the Registrars MUST be announced with as many resource paths.  The discovery of EST server in the http environment follow the rules specified in [RFC7030].

When server-side key generation is used, if the private key is protected using symmetric keys then the Registrar needs to encrypt the private key down to the client with one symmetric key and decrypt it from the server with another.  If no private key encryption takes place the Registrar will be able to see the key as it establishes a separate connection to the server.  In the case of asymmetrically encrypted private key, the Registrar may not be able to decrypt it if the server encrypted it with a public key that corresponds to a private key that belongs to the client.

## 8.  Parameters

THis section addresses transmission parameters described in sections 4.7 and 4.8 of the CoAP document [RFC7252].

```
ACK_TIMEOUT        | 2 seconds      |
ACK_RANDOM_FACTOR  | 1.5           |
MAX_RETRANSMIT     | 4             |
NSTART             | 1             |
DEFAULT_LEISURE    | 5 seconds     |
PROBING_RATE       | 1 byte/second |
```

Figure 4: EST-COAP protocol parameters

EST does not impose any unique parameters that affect the CoAP parameters in Table 2 and 3 in the CoAP draft but the ones in CoAP could be affecting EST.  For example, the processing delay of CAs could be less then 2s, but in this case they should send a CoAP ACK every 2s while processing.

The main recommendation, based on experiments using Nexus Certificate Manager with Californium for CoAP support, communicating with a ContikiOS and tinyDTLS based client, from RISE SICS, is to start with the default CoAP configuration parameters.

However, depending on the implementation scenario, resending and timeouts can also occur on other networking layers, governed by other configuration parameters.

Some further comments about some specific parameters, mainly from Table 2 in [RFC7252]:

o  DEFAULT_LEISURE: This setting is only relevant in multicast
   scenarios, outside the scope of the EST-coaps draft.

o  NSTART: Limit the number of simultaneous outstanding interactions
   that a client maintains to a given server.  The default is one,
   hence is the risk of congestion or out-of-order messages already
   limited.

o  PROBING_RATE: A parameter which specifies the rate of re-sending
   non-confirmable messages.  The EST messages are defined to be sent
   as CoAP confirmable messages, hence the PROBING_RATE setting is
   not applicable.

Finally, the Table 3 parameters are mainly derived from the more basic Table 2 parameters.  If the CoAP implementation allows setting them directly, they might need to be updated if the table 2 parameters are changed.

## 9.  IANA Considerations

### 9.1.  Content-Format Registry

Additions to the sub-registry "CoAP Content-Formats", within the "CoRE Parameters" registry are specified in Table 2.  These can be registered either in the Expert Review range (0-255) or IETF Review range (256-9999).

```
+-------------------------+--------+-----+-------------------------+
| Media type              | Encodi |  ID | Reference               |
|                         | ng     |     |                         |
+-------------------------+--------+-----+-------------------------+
| application/pkcs7-mime; | -      | TBD | [RFC5751] [RFC7030]     |

```

                    Table 2: New CoAP Content-Formats

## 9.2.  Resource Type registry

   Additions to the sub-registry "CoAP Resource Type", within the "CoRE
   Parameters" registry are needed for a new resource type.

   o  rt="ace.est" needs registration with IANA.

## 10.  Security Considerations

## 10.1.  EST server considerations

   The security considerations of Section 6 of [RFC7030] are only
   partially valid for the purposes of this document.  As HTTP Basic
   Authentication is not supported, the considerations expressed for
   using passwords do not apply.

   Given that the client has only limited resources and may not be able
   to generate sufficiently random keys to encrypt its identity, it is
   possible that the client uses server generated private/public keys to
   encrypt its certificate.  The transport of these keys is inherently
   risky.  A full probability analysis MUST be done to establish whether
   server side key generation enhances or decreases the probability of
   identity stealing.

When a client uses the Implicit TA database for certificate validation, the client cannot verify that the implicit database can act as an RA.  It is RECOMMENDED that such clients include "Linking Identity and POP Information" Section 6 in requests (to prevent such requests from being forwarded to a real EST server by a man in the middle).  It is RECOMMENDED that the Implicit Trust Anchor database used for EST server authentication be carefully managed to reduce the chance of a third-party CA with poor certification practices from being trusted.  Disabling the Implicit Trust Anchor database after successfully receiving the Distribution of CA certificates response (Section 4.1.3 of [RFC7030]) limits any risk to the first DTLS exchange.

In accordance with [RFC7030], TLS cipher suites that include "_EXPORT_" and "_DES_" in their names MUST NOT be used.  More information about recommendations of TLS and DTLS are included in [RFC7525].

As described in CMC, Section 6.7 of [RFC5272], "For keys that can be used as signature keys, signing the certification request with the private key serves as a POP on that key pair".  The inclusion of tls-unique in the certification request links the proof-of-possession to the TLS proof-of-identity.  This implies but does not prove that the authenticated client currently has access to the private key.

Regarding the Certificate Signing Request (CSR), an adversary could exclude attributes that a server may want, include attributes that a server may not want, and render meaningless other attributes that a server may want.  The CA is expected to be able to enforce policies to recover from improper CSR requests.

Interpreters of ASN.1 structures should be aware of the use of invalid ASN.1 length fields and should take appropriate measures to guard against buffer overflows, stack overruns in particular, and malicious content in general.

## 10.2.  HTTPS-CoAPS Registrar considerations

The Registrar proposed in Section 7 must be deployed with care, and only when the recommended connections are impossible.  When POP is used the Registrar terminating the TLS connection establishes a new one with the upstream CA.  Thus, it is impossible for POP to be enforced throughout the EST transaction.  The EST server could be configured to accept POP linking information that does not match the current TLS session because the authenticated EST Registrar client has verified this information when acting as an EST server.  The introduction of an EST-coaps-to-HTTP Registrar assumes the client can trust the registrar using its implicit or explicit TA database.  It

also assumes the Registrar has a trust relationship with the upstream
EST server in order to act on behalf of the clients.

In a server-side key generation case, depending on the private key
encryption method, the Registrar may be able see the private key as
it acts as a man-in-the-middle.  Thus, the clients puts its trust on
the Registrar not exposing the private key.

For some use cases, clients that leverage server-side key generation
might prefer for the enrolled keys to be generated by the Registrar
if the CA does not support server-side key generation.  In these
cases the Registrar must support the random number generation using
proper entropy.  Since the client has no knowledge if the Registrar
will be generating the keys and enrolling the certificates with the
CA or if the CA will be responsible for generating the keys, the
existence of a Registrar requires the client to put its trust on the
registrar doing the right thing if it is generating they private
keys.

## 11.  Acknowledgements

The authors are very grateful to Klaus Hartke for his detailed
explanations on the use of Block with DTLS and his support for the
content-format specification.  The authors would like to thank Esko
Dijk and Michael Verschoor for the valuable discussions that helped
in shaping the solution.  They would also like to thank Peter
Panburana for his feedback on technical details of the solution.
Constructive comments were received from Benjamin Kaduk, Eliot Lear,
Jim Schaad, Hannes Tschofenig, Julien Vermillard, and John Manuel.

## 12.  Change Log

-03:

   Removed observe and simplified long waits

   Repaired content-format specification

-02:

   Added parameter discussion in section 8

   Concluded content-format specification using multipart-ct draft

   examples updated

-01:

Editorials done.

Redefinition of proxy to Registrar in Section 7.  Explained better the role of https-coaps Registrar, instead of "proxy"

Provide "observe" option examples

extended block message example.

inserted new server key generation text in Section 4.5 and motivated server key generation.

Broke down details for DTLS 1.3

New media type uses CBOR array for multiple content-format payloads

provided new content format tables

new media format for IANA

-00

copied from vanderstok-ace-coap-04

## Appendix A.  EST messages to EST-coaps

   This section takes all examples from Appendix A of [RFC7030], changes
   the payload from Base64 to binary and replaces the http headers by
   their CoAP equivalents.

   The corresponding CoAP headers are only shown in Appendix A.1.
   Creating CoAP headers are assumed to be generally known.

   Binary payload is a CBOR major type 2 (byte array), that is shown
   with a base16 (hexadecimal) CBOR diagnostic notation.

   [EDNOTE: The payloads of the examples need to be re-generated with
   appropriate tools and example certificates.]

   These examples assume that the resource discovery, returned a short
   URL of "/est".

   In EST-coaps, a coaps cacerts IPv4 message can be:

   GET coaps://192.0.2.1:8085/est/crts

   The corresponding CoAP header fields are shown below.  The use of
   block and DTLS are worked out in [Appendix B](#).

```
  Ver = 1
  T = 0 (CON)
  Code = 0x01 (0.01 is GET)
  Token = 0x9a (client generated)
  Options
   Option1 (Uri-Host)               [optional]
     Option Delta = 0x3  (option nr = 3)
     Option Length = 0x9
     Option Value = 192.0.2.1
   Option2 (Uri-Port)               [optional]
     Option Delta = 0x4  (option nr = 3+4=7)
     Option Length = 0x4
     Option Value = 8085
   Option3 (Uri-Path)
     Option Delta = 0x4   (option nr = 7+4= 11)
     Option Length = 0x5
     Option Value = "est"
   Option4 (Uri-Path)
     Option Delta = 0x0   (option nr = 11+0= 11)
     Option Length = 0x6
     Option Value = "crts"
   Option5 (Max-Age)
     Option Delta = 0x3   (option nr = 11+3= 14)
     Option Length = 0x1
     Option Value = 0x1    (1 minute)
  Payload = [Empty]
```

   A 2.05 Content response with a cert in EST-coaps will then be:

   2.05 Content (Content-Format: TBD2)
      {payload}

   with CoAP fields

```
  Ver = 1
```

```
   T = 2 (ACK)
   Code = 0x45 (2.05 Content)
   Token = 0x9a    (copied by server)
   Options
     Option1 (Content-Format)
       Option Delta = 0xC  (option nr =12)
       Option Length = 0x2
       Option Value = TBD2 (defined in this document)

   Payload =
```

## A.2. csrattrs

In the following valid /csrattrs exchange, the EST-coaps client authenticates itself with a certificate issued by the connected CA.

The initial DTLS handshake is identical to the enrollment example. The IPv6 CoAP GET request looks like:

```
REQ:
GET coaps://[2001:db8::2:1]:61616/est/att
(Content-Format: TBD6)
```

A 2.05 Content response contains attributes which are relevant for the authenticated client.  In this example, the EST-coaps server returns two attributes that the client can ignore when they are unknown to him.

## A.3. enroll / reenroll

During the Enroll/Reenroll exchange, the EST-coaps client uses a CSR (Content-Format TBD7) request in the POST request payload.

After verification of the CSR by the server, a 2.05 Content response
with the issued certificate will be returned to the client.  As
described in Section 4.4, if the server is not able to provide a
response immediately, it sends an empty ACK with response code 5.03
(Service Unavailabel) and the Max-Age option.  See Figure 3 for an
example exchange.

[EDNOTE: When redoing this example, given that proof of possession
(POP) is also used, make sure it is obvious that the
ChallengePassword attribute in the CSR is valid HMAC output.  HMAC-
REAL.]

Without the DecryptKeyIdentifier attribute, the response has no
additional encryption beyond DTLS.

The response contains first a preamble that can be ignored.  The EST-
coaps server can use the preamble to include additional explanations,
like ownership or support information

**Appendix B.  EST-coaps Block message examples**

Two examples are presented: (1) a cacerts exchange shows the use of
Block2 and the block headers, and (2) a enroll exchange shows the
Block1 and Block2 size negotiation for request and response payloads.

**B.1.  cacerts block example**

This section provides a detailed example of the messages using DTLS
and BLOCK option Block2.  The minimum PMTU is 1280 bytes, which is
the example value assumed for the DTLS datagram size.  The example
block length is taken as 64 which gives an SZX value of 2.

The following is an example of a valid /cacerts exchange over DTLS.
The content length of the cacerts response in appendix A.1 of
[RFC7030] is 4246 bytes using base64.  This leads to a length of 2509
bytes in binary.  The CoAP message adds around 10 bytes, the DTLS
record 29 bytes.  To avoid IP fragmentation, the CoAP block option is
used and an MTU of 127 is assumed to stay within one IEEE 802.15.4
packet.  To stay below the MTU of 127, the payload is split in 39
packets with a payload of 64 bytes each, followed by a packet of 13
bytes.  The client sends an IPv6 packet containing the UDP datagram
with the DTLS record that encapsulates the CoAP Request 40 times.
The server returns an IPv6 packet containing the UDP datagram with
the DTLS record that encapsulates the CoAP response.  The CoAP
request-response exchange with block option is shown below.  Block
option is shown in a decomposed way (block-option:NUM/M/size)
indicating the kind of Block option (2 in this case because used in
the response) followed by a colon, and then the block number (NUM),
the more bit (M = 0 in lock2 response means last block), and block
size with exponent (2**(SZX+4)) separated by slashes.  The Length 64
is used with SZX= 2 to avoid IP fragmentation.  The CoAP Request is
sent with confirmable (CON) option and the content format of the
Response is /application/cacerts.

```
   GET /192.0.2.1:8085/est/crts   (2:0/0/64)    -->
                <--   (2:0/1/64) 2.05 Content
   GET /192.0.2.1:8085/est/crts   (2:1/0/64)    -->
                <--   (2:1/1/64) 2.05 Content
                         |
                         |
                         |
   GET /192.0.2.1:8085/est/crts    (2:39/0/64)  -->
                <--   (2:39/0/64) 2.05 Content
```

40 blocks have been sent with partially filled block NUM=39 as last
block.

For further detailing the CoAP headers, the first two blocks are
written out.

The header of the first GET looks like:

```
  Ver = 1
  T = 0 (CON)
  Code = 0x01 (0.1 GET)
  Token = 0x9a    (client generated)
  Options
   Option1 (Uri-Host)            [optional]
     Option Delta = 0x3  (option nr = 3)
     Option Length = 0x9
     Option Value = 192.0.2.1
   Option2 (Uri-Port)            [optional]
     Option Delta = 0x4   (option nr = 3+4=7)
     Option Length = 0x4
     Option Value = 8085
   Option3 (Uri-Path)
     Option Delta = 0x4    (option nr = 7+4=11)
     Option Length = 0x5
     Option Value = "est"
   Option4 (Uri-Path)
     Option Delta = 0x0    (option nr = 11+0=11)
     Option Length = 0x6
     Option Value = "crts"
  Payload = [Empty]
```

The header of the first response looks like:

```
   Ver = 1
   T = 2 (ACK)
   Code = 0x45 (2.05 Content)
   Token = 0x9a     (copied by server)
   Options
     Option1 (Content-Format)
       Option Delta = 0xC  (option nr =12)
       Option Length = 0x2
       Option Value = TBD2
     Option2 (Block2)
       Option Delta = 0xB  (option 23 = 12 + 11)
       Option Length = 0x1
       Option Value = 0x0A (block number = 0, M=1, SZX=2)
   Payload =
 h'30233906092a6206734107028c2a30232602010131003000b06092a6206734107018
 c0c3020bb302063c20102020900a61e75193b7acc0d06092a6206734101'

The second Block2:

   Ver = 1
   T = 2 (means ACK)
   Code = 0x45 (2.05 Content)
   Token = 0x9a      (copied by server)
   Options
     Option1 (Content-Format)
       Option Delta = 0xC  (option nr =12)
       Option Length = 0x2
       Option Value = TBD2
     Option2 (Block2)
       Option Delta = 0xB  (option 23 = 12 + 11)
       Option Length = 0x1
       Option Value = 0x1A (block number = 1, M=1, SZX=2)
   Payload =
 h'05050030
 1b3119301706035504031310657374445 78616d706c654341204f774f301e170d313
 330353039303335333315a170d31343035303930333353333315a'

The 40th and final Block2:
```

```
      Ver = 1
      T = 2 (means ACK)
      Code = 0x45      (2.05 Content)
      Token = 0x9a     (copied by server)
      Options
        Option1 (Content-Format)
          Option Delta = 0xC  (option nr =12)
          Option Length = 0x2
          Option Value = TBD2
        Option2 (Block2)
          Option Delta = 0xB  (option 23 = 12 + 11)
          Option Length = 0x2
          Option Value = 0x272 (block number = 39, M=0, SZX=2)
      Payload = h'73a30d0c006343116f58403100'
```

## [B.2]. enroll block example

In this example the requested block2 size of 256 bytes, required by
the client, is transferred to the server in the very first request
message.  The request/response consists of two parts: part1
containing the CSR transferred to the server, and part2 contains the
certificate transferred back to the client.  The block size
256=(2**(SZX+4)) which gives SZX=4.  The notation for block numbering
is the same as in [Appendix B.1].  It is assumed that CSR takes N1+1
blocks and Cert response takes N2+1 blocks.  The header fields and
the payload are omitted to show the block exchange.  The type of
payload is shown within curly brackets.

```
   POST [2001:db8::2:1]:61616/est/sen (CON)(1:0/1/256) {CSR req} -->
         <-- (ACK) (1:0/1/256) (2.31 Continue)
   POST [2001:db8::2:1]:61616/est/sen (CON)(1:1/1/256) {CSR req} -->
         <-- (ACK) (1:1/1/256) (2.31 Continue)
                       .
                       .
                       .
   POST [2001:db8::2:1]:61616/est/sen (CON)(1:N1/0/256){CSR req} -->
         <-- (ACK) (1:N1/0/256) (2:0/1/256) (2.04 Changed){Cert resp}
   POST [2001:db8::2:1]:61616/est/sen (CON)(2:1/0/256)          -->
         <-- (ACK) (2:1/1/256) (2.04 Changed) {Cert resp}
                       .
                       .
                       .
   POST [2001:db8::2:1]:61616/est/sen (CON)(2:N2/0/256)         -->
         <-- (ACK) (2:N2/0/256) (2.04 Changed) {Cert resp}
```

            Figure 5: EST-COAP enrolment with multiple blocks

   N1+1 blocks have been transferred from client to server and N2+1
   blocks have been transferred from server to client.
