       Extensions to Automatic Certificate Management Environment for end-user
                        S/MIME certificates
                  draft-ietf-acme-email-smime-09

Abstract

   This document specifies identifiers and challenges required to enable
   the Automated Certificate Management Environment (ACME) to issue
   certificates for use by email users that want to use S/MIME.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months
   and may be updated, replaced, or obsoleted by other documents at any
   time. It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on April 30, 2021.

Table of Contents

1. Introduction

   ACME [RFC8555] is a mechanism for automating certificate management
   on the Internet. It enables administrative entities to prove
   effective control over resources like domain names, and automates the
   process of generating and issuing certificates.

   This document describes an extension to ACME for use by S/MIME.
   Section 3 defines extensions for issuing end-user S/MIME [RFC8550]
   certificates.

2. Conventions Used in This Document

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
   document are to be interpreted as described in [RFC2119].

3. Use of ACME for issuing end-user S/MIME certificates

   ACME [RFC8555] defines a "dns" Identifier Type that is used to verify
   that a particular entity has control over a domain or specific
   service associated with the domain. In order to be able to issue
   end-user S/MIME certificates, ACME needs a new Identifier Type that
   proves ownership of an email address.

   This document defines a new Identifier Type "email" which corresponds
   to an (all ASCII) email address [RFC5321] or Internationalized Email
   addresses [RFC6531]. (When Internationalized Email addresses are
   used, both U-labels and A-labels [RFC5890] are allowed in the domain
   part.) This can be used with S/MIME or other similar service that
   requires possession of a certificate tied to an email address.

Any identifier of type "email" in a newOrder request MUST NOT have a wildcard ("*") character in its value.

A new challenge type "email-reply-00" is used with "email" Identifier Type, which provides proof that an ACME client has control over an email address:

1. An end-user initiates issuance of an S/MIME certificate for one of her email addresses. This might be done using email client UI (and might use some HTTP API underneath), by visiting a Certificate Authority web page or by sending an email to a well known Certificate Authority's email address. This document doesn't prescribe how exactly S/MIME certificate issuance is initiated.

2. The ACME server (run by the Certificate Authority or their authorized third party) generates a "challenge" email message with the subject "ACME: <token-part1>", where <token-part1> is the base64url encoded [RFC4648] first part of the token, which contains at least 64 bits of entropy. (ACME server MUST generate token afresh for each S/MIME issuance request.) The challenge email message structure is described in more details in Section 3.1. The second part of the token (token-part2, which also contains at least 64 bits of entropy) is returned over HTTPS [RFC2818] to the ACME client.

3. The ACME client concatenates "token-part1" and "token-part2" to create "token", calculates keyAuthorization (as per Section 8.1 of [RFC8555]), then includes the base64url encoded SHA-256 digest [FIPS180-4] of the key authorization in the body of a response email message containing a single text/plain MIME body part [RFC2045]. The response email message structure is described in more details in Section 3.2.

For an identifier of type "email", the PKCS#10 [RFC2986] Certificate Signing Request (CSR) MUST contain the requested email address in an extensionRequest attribute [RFC2985] requesting a subjectAltName extension.

3.1. ACME challenge email

A "challenge" email message MUST have the following structure:

1. The message Subject header field has the following syntax: "ACME: <token-part1>", where the prefix "ACME:" is followed by folding white space (FWS, see [RFC5322]) and then by <token-part1>, which is the base64url encoded first part of the ACME token that MUST be at least 64 bits long after decoding. Due to the recommended

78-octet line length limit in [RFC5322], the subject line can be folded, so whitespaces (if any) within the <token-part1> MUST be ignored. [RFC2231] encoding of the message Subject header field MUST be supported, but when used, only "UTF-8" and "US-ASCII" charsets MUST be used (i.e. other charsets MUST NOT be used).

2. The To header field MUST be the email address of the entity that requested the S/MIME certificate to be generated.

3. The message MAY contain a Reply-To header field.

4. The message MUST include the "Auto-Submitted: auto-generated" header field [RFC3834]. The "Auto-Submitted" header field SHOULD include the "type=acme" parameter. It MAY include other optional parameters as allowed by the syntax of the Auto-Submitted header field.

5. In order to prove authenticity of a challenge message, it MUST be either DKIM [RFC6376] signed or S/MIME [RFC8551] signed. If DKIM signing is used, the resulting DKIM-Signature header field MUST contain the "h=" tag that includes at least "From", "Sender", "Reply-To", "To", "CC", "Subject", "Date", "In-Reply-To", "References", "Message-ID", "Content-Type", and "Content-Transfer-Encoding" header fields. The message MUST also pass DMARC validation [RFC7489], which implies DKIM and SPF validation [RFC7208].

6. The body of the challenge message is not used for automated processing, so it can be any media type. (However there are extra requirements on S/MIME signing, if used. See below.) Typically it is text/plain or text/html containing a human-readable explanation of the purpose of the message. If S/MIME signing is used to prove authenticity of the challenge message, then the multipart/signed or "application/pkcs7-mime; smime-type=signed-data;" media type should be used. Either way, it MUST use S/MIME header protection.

An example ACME "challenge" email (note that DKIM related header
fields are not included for simplicity).

```
Auto-Submitted: auto-generated; type=acme
Date: Sat, 1 Sep 2018 10:08:55 +0100
Message-ID: <A2299BB.FF7788@example.org>
From: acme-generator@example.org
To: alexey@example.com
Subject: ACME: <base64url-encoded-token-with-64-bits-of-entropy>
Content-Type: text/plain
MIME-Version: 1.0

This is an automatically generated ACME challenge for email address
"alexey@example.com". If you haven't requested an S/MIME
certificate generation for this email address, be very afraid.
If you did request it, your email client might be able to process
this request automatically, or you might have to paste the first
token part into an external program.
```

                              Figure 1

3.2. ACME response email

A valid "response" email message MUST have the following structure:

1. The message Subject header field has the following syntax:
    "<Reply-prefix> ACME: <token-part1>", where <Reply-prefix> is
    typically the reply prefix "Re:" and the string "ACME:" is
    preceded and followed by folding white space (FWS, see [RFC5322])
    and then by <token-part1>. <token-part1> is the base64url encoded
    first part of the ACME token (as received in the ACME challenge)
    that MUST be at least 64 bits long after decoding. Due to
    recommended 78 octet line length limit in [RFC5322], the subject
    line can be folded, so whitespaces (if any) within the <token-
    part1> MUST be ignored. [RFC2231] encoding of the Subject header
    field MUST be supported, but when used, only "UTF-8" and "US-
    ASCII" charsets MUST be used (i.e. other charsets MUST NOT be
    used). When parsing subjects, ACME servers must decode [RFC2231]
    encoding (if any) and then they can ignore any prefix before the
    "ACME:" label.

2. The From: header field contains the email address of the user
    that is requesting S/MIME certificate issuance.

3. The To: header field of the response contains the value from the
    Reply-To: header field from the challenge message (if set) or
    from the From: header field of the challenge message otherwise.

4. The Cc: header field is ignored if present in the "response"
    email message.

5. The In-Reply-To: header field SHOULD be set to the Message-ID
    header field of the challenge message according to rules in
    Section 3.6.4 of [RFC5322].

6. List-* header fields [RFC4021][RFC8058] MUST be absent (i.e., the
    reply can't come from a mailing list)

7. The media type of the "response" email message is either text/
    plain or multipart/alternative containing text/plain as one of
    the alternatives. The text/plain body part (whether or not it is
    inside multipart/alternative) MUST contain a block of lines
    starting with the line "-----BEGIN ACME RESPONSE-----", followed
    by one or more line containing the base64url-encoded SHA-256
    digest [FIPS180-4] of the key authorization, calculated from
    concatenated token-part1 (received over email) and token-part2
    (received over HTTPS). See the 3rd bullet point in Section 3 for
    more details. (Note that due to historical line length
    limitations in email, line endings (CRLFs) can be freely inserted
    in the middle of the encoded digest, so they MUST be ignored when
    processing it.) The final line of the encoded digest is followed
    by a line containing "-----END ACME RESPONSE-----". Any text
    before and after this block is ignored. For example such text
    might explain what to do with it for ACME-unaware clients.

8. There is no need to use any Content-Transfer-Encoding other than
    7bit for the text/plain body part, however use of Quoted-
    Printable or base64 is not prohibited in a "response" email
    message.

9. In order to prove authenticity of a response message, it MUST be
    DKIM [RFC6376] signed. The resulting DKIM-Signature header field
    MUST contain the "h=" tag that includes at least "From",
    "Sender", "Reply-To", "To", "CC", "Subject", "Date", "In-Reply-
    To", "References", "Message-ID", "Content-Type", and "Content-
    Transfer-Encoding" header fields. The message MUST also pass
    DMARC validation [RFC7489], which implies DKIM and SPF validation
    [RFC7208].

Example ACME "response" email (note that DKIM related header fields
are not included for simplicity).

4. Internationalization Considerations

[RFC8616] updated/clarified use of DKIM/SPF/DMARC with
Internationalized Email addresses [RFC6531]. Please consult RFC 8616
in regards to any changes that need to be implemented.

Use of non ASCII characters in left hand sides of Internationalized
Email addresses requires putting Internationalized Email Addresses in
X.509 Certificates [RFC8398].

5. IANA Considerations

5.1. ACME Identifier Type

IANA is requested to register a new Identifier type in the "ACME
Identifier Types" registry defined in Section 9.7.7 of [RFC8555] with
Label "email" and a Reference to [RFCXXXX], [RFC5321] and [RFC6531].
The new Identifier Type corresponds to an (all ASCII) email address
[RFC5321] or Internationalized Email addresses [RFC6531].

5.2. ACME Challenge Type

IANA is also requested to register a new entry in the "ACME
Validation Methods" registry defined in Section 9.7.8 of [RFC8555].
This entry is as follows:

```
+----------------+----------------+------+-----------+
|     Label      | Identifier Type | ACME | Reference |
+----------------+----------------+------+-----------+
| email-reply-00 |     email      |  Y   | [RFCXXXX] |
+----------------+----------------+------+-----------+
```

6. Security Considerations

Please see Security Considerations of [RFC8555] for general security
considerations related to use of ACME. This challenge/response
protocol demonstrates that an entity that controls the private key
(corresponding to the public key in the certificate) also controls
the named email account. Any claims about the correctness or
fitness-for-purpose of the email address must be otherwise assured.
I.e. ACME server is only vouching that the requested email address
seem to belong to the entity that requested the certificate.

The security of the "email-reply-00" challenge type depends on the
security of the email system. A third party that can read and reply
to user's email messages (by possessing a user's password or a secret
derived from it that can give read and reply access, such as
"password equivalent" information; or by being given permissions to
act on a user's behalf using email delegation feature common in some
email systems) can request S/MIME certificates using the protocol
specified in this document and is indistinguishable from the email
account owner. This has several possible implications:

1. an entity that compromised an email account would be able to
    request S/MIME certificates using the protocol specified in this
    document and such entity couldn't be distinguished from the
    legitimate email account owner (unless some external sources of
    information are consulted);

2. for email addresses with legitimate shared access/control by
    multiple users, any such user would be able to request S/MIME
    certificates using the protocol specified in this document and
    such requests can't be attributed to a specific user without
    consulting external systems (such as IMAP/SMTP access logs);

3. protocol specified in this document is not suitable for use with
    email addresses associated with mailing lists [RFC5321].

An email system in its turn depends on DNS. A third party that can
manipulate DNS MX records for a domain might be able to redirect
email and can get (at least temporary) read and reply access to it.
Similar considerations apply to SPF and DMARC TXT records in DNS.
Use of DNSSEC by email system administrators is recommended to avoid
easy spoofing of DNS records affecting email system.
