Constrained Voucher Artifacts for Bootstrapping Protocols
draft-ietf-anima-constrained-voucher-03

Abstract

This document defines a strategy to securely assign a pledge to an owner, using an artifact signed, directly or indirectly, by the pledge's manufacturer. This artifact is known as a "voucher".

This document builds upon the work in [[RFC8366](#)], encoding the resulting artifact in CBOR. Use with two signature technologies are described.

Additionally, this document explains how constrained vouchers may be transported in the [[I-D.ietf-ace-coap-est](#)] protocol.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 26, 2019.

[1.](#) Introduction

Enrollment of new nodes into constrained networks with constrained nodes present unique challenges.

There are bandwidth and code space issues to contend. A solution such as [[I-D.ietf-anima-bootstrapping-keyinfra](#)] may be too large in terms of code space or bandwidth required.

This document defines a constrained version of [[RFC8366](#)]. Rather than serializing the YANG definition in JSON, it is serialized into CBOR ([[RFC7049](#)]).

This document follows a similar, but not identical structure as [[RFC8366](#)]. Some sections are left out entirely. Additional sections have been added concerning:

1. Addition of voucher-request specification as defined in [[I-D.ietf-anima-bootstrapping-keyinfra](#)],
2. Addition to [[I-D.ietf-ace-coap-est](#)] of voucher transport requests over coap.

The CBOR definitions for this constrained voucher format are defined using the mechanism describe in [[I-D.ietf-core-yang-cbor](#)] using the SID mechanism explained in [[I-D.ietf-core-sid](#)]. As the tooling to convert YANG documents into an list of SID keys is still in its infancy, the table of SID values presented here should be considered normative rather than the output of the pyang tool.

Two methods of signing the resulting CBOR object are described in this document:

1. One is CMS [[RFC5652](#)].
2. The other is COSE [[RFC8152](#)] signatures.

2. Terminology

The following terms are defined in [[RFC8366](#)], and are used identically as in that document: artifact, imprint, domain, Join Registrar/Coordinator (JRC), Manufacturer Authorized Signing Authority (MASA), pledge, Trust of First Use (TOFU), and Voucher.

3. Requirements Language

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[RFC2119](#)] and indicate requirement levels for compliant STuPiD implementations.

4. Survey of Voucher Types

[RFC8366] provides for vouchers that assert proximity, that authenticate the registrar and that include different amounts of anti-replay protection.

This document does not make any extensions to the types of vouchers.

Time based vouchers are included in this definition, but given that constrained devices are extremely unlikely to know the correct time, their use is very unlikely. Most users of these constrained vouchers will be online and will use live nonces to provide anti-replay protection.

[RFC8366] defined only the voucher artifact, and not the Voucher Request artifact, which was defined in [[I-D.ietf-anima-bootstrapping-keyinfra](#)].

This document defines both a constrained voucher and a constrained voucher-request. They are presented in the order voucher-request, followed by voucher response as this is the time order that they occur.

This document defines both CMS-signed voucher requests and responses, and COSE signed voucher requests and responses. The use of CMS signatures implies the use of PKIX format certificates. The pinned-domain-cert present in such a voucher, is the certificate of the Registrar.

The use of COSE signatures permits the use of both PKIX format certificates, and also raw public keys (RPK). When RPKs are used, the voucher produced by the MASA pins the raw public key of the Registrar: the pinned-domain-subject-public-key-info in such a

voucher, is the raw public key of the Registrar. This is described in the YANG definition for the constrained voucher.

5. Discovery and URI

This section describes the BRSKI extensions to EST-coaps [[I-D.ietf-ace-coap-est](#)] to transport the voucher between registrar, proxy and pledge over CoAP. The extensions are targeted to low-resource networks with small packets. Saving header space is important and the EST-coaps URI is shorter than the EST URI.

The presence and location of (path to) the management data are discovered by sending a GET request to `/.well-known/core` including a resource type (RT) parameter with the value `"ace.est"` [[RFC6690](#)]. Upon success, the return payload will contain the root resource of the EST resources. It is up to the implementation to choose its root resource; throughout this document the example root resource `/est` is used. The example below shows the discovery of the presence and location of voucher resources.

```
REQ: GET /.well-known/core?rt=ace.est
```

```
RES: 2.05 Content
</est>; rt="ace.est"
```

The EST-coaps server URIs differ from the EST URI by replacing the scheme `https` by `coaps` and by specifying shorter resource path names:

```
coaps://www.example.com/est/short-name
```

Figure 5 in [section 3.2.2 of \[RFC7030\]](#) enumerates the operations and corresponding paths which are supported by EST. Table 1 provides the mapping from the BRSKI extension URI path to the EST-coaps URI path.

BRSKI	EST-coaps
<code>/requestvoucher</code>	<code>/rv</code>
<code>/voucher-status</code>	<code>/vs</code>
<code>/enrollstatus</code>	<code>/es</code>
<code>/requestauditlog</code>	<code>/ra</code>

Table 1: BRSKI path to EST-coaps path

/requestvoucher and /enrollstatus are needed between pledge and Registrar.

When discovering the root path for the EST resources, the server MAY return the full resource paths and the used content types. This is useful when multiple content types are specified for EST-coaps server. For example, the following more complete response is possible.

```
REQ: GET /.well-known/core?rt=ace.est*

RES: 2.05 Content
</est>; rt="ace.est"
</est/rv>; rt="ace.est/rv";ct=50 60 TBD2 TBD3 16
</est/vs>; rt="ace.est/vs";ct=50 60
</est/es>; rt="ace.est/es";ct=50 60
</est/ra>; rt="ace.est/ra";ct=TBD2 TBD3 16
```

The first line MUST be returned in response to the GET, The following four lines MAY be returned to show the supported Content-Formats. The return of the content-types allows the client to choose the most appropriate one from multiple content types.

Port numbers, not returned in the example, are assumed to be the default numbers 5683 and 5684 for coap and coaps respectively (sections [12.6](#) and [12.7](#) of [\[RFC7252\]](#)). Discoverable port numbers MAY be returned in the <href> of the payload.

ct=16 stands for the Content-Format "application/cose", and ct=TBD2 stands for Content-Format "application/voucher-cms+cbor", and ct=TBD3 stands for Content-Format "application/voucher-cose+cbor".

Content-Formats TBD2 and TBD3 are defined in this document. The return of the content-formats allows the client to choose the most appropriate one from multiple content formats.

The Content-Format ("application/json") 50 MAY be supported. Content-Formats ("application/cbor") 60, TBD2, TBD3, and 16 MUST be supported.

6. Artifacts

This section describes the abstract (tree) definition as explained in [\[I-D.ietf-netmod-yang-tree-diagrams\]](#) first. This provides a high-level view of the contents of each artifact.

Then the assigned SID values are presented. These have been assigned using the rules in [[I-D.ietf-core-yang-cbor](#)], with an allocation that was made via the <http://comi.space> service.

[6.1.](#) Voucher Request artifact

[6.1.1.](#) Tree Diagram

The following diagram is largely a duplicate of the contents of [[RFC8366](#)], with the addition of proximity-registrar-subject-public-key-info, proximity-registrar-cert, and prior-signed-voucher-request.

prior-signed-voucher-request is only used between the Registrar and the MASA. proximity-registrar-subject-public-key-info replaces proximity-registrar-cert for the extremely constrained cases.

6.1.3. YANG Module

In the constrained-voucher-request YANG module, the voucher is "augmented" within the "used" grouping statement such that one continuous set of SID values is generated for the constrained-

voucher-request module name, all voucher attributes, and the constrained-voucher-request attribute. Two attributes of the voucher are "refined" to be optional.

```
<CODE BEGINS> file "ietf-constrained-voucher-request@2018-09-01.yang"
module ietf-constrained-voucher-request {
  yang-version 1.1;

  namespace
    "urn:ietf:params:xml:ns:yang:ietf-constrained-voucher-request";
  prefix "constrained";

  import ietf-restconf {
    prefix rc;
    description
      "This import statement is only present to access
       the yang-data extension defined in RFC 8040.";
    reference "RFC 8040: RESTCONF Protocol";
  }

  import ietf-voucher {
    prefix "v";
  }

           <mailto:consultancy@vanderstok.org>
    Author: Panos Kampanakis
           <mailto:pkampana@cisco.com>";

  description
    "This module defines the format for a voucher request,
     which is produced by a pledge to request a voucher.
     The voucher-request is sent to the potential owner's
     Registrar, which in turn sends the voucher request to
     the manufacturer or delegate (MASA).

     A voucher is then returned to the pledge, binding the
     pledge to the owner. This is a constrained version of the
     voucher-request present in
     draft-ietf-anima-bootstrap-keyinfra.txt."
  }
}
```

This version provides a very restricted subset appropriate for very constrained devices.

In particular, it assumes that nonce-ful operation is always required, that expiration dates are rather weak, as no clocks can be assumed, and that the Registrar is identified by a pinned Raw Public Key.

The key words 'MUST', 'MUST NOT', 'REQUIRED', 'SHALL', 'SHALL NOT', 'SHOULD', 'SHOULD NOT', 'RECOMMENDED', 'MAY', and 'OPTIONAL' in the module text are to be interpreted as described in [RFC 2119](#)."

6.3. CMS format voucher and voucher-request artifacts

The IETF evolution of PKCS#7 is CMS [[RFC5652](#)]. The CMS signed voucher is much like the equivalent voucher defined in [[RFC8366](#)].

A different eContentType of TBD1 is used to indicate that the contents are in a different format than in [[RFC8366](#)].

The ContentInfo structure contains a payload consisting of the CBOR encoded voucher. The [[I-D.ietf-core-yang-cbor](#)] use of delta encoding

creates a canonical ordering for the keys on the wire. This canonical ordering is not important as there is no expectation that the content will be reproduced during the validation process.

Normally the recipient is the pledge and the signer is the MASA.

[I-D.ietf-anima-bootstrapping-keyinfra] supports both signed and unsigned voucher requests from the pledge to the JRC. In this specification, voucher-request artifact is not signed from the pledge to the registrar. From the JRC to the MASA, the voucher-request artifact MUST be signed by the domain owner key which is requesting ownership.

The considerations of [\[RFC5652\] section 5.1](#), concerning validating CMS objects which are really PKCS7 objects (cmsVersion=1) applies.

The CMS structure SHOULD also contain all the certificates leading up to and including the signer's trust anchor certificate known to the recipient. The inclusion of the trust anchor is unusual in many applications, but without it third parties can not accurately audit the transaction.

The CMS structure MAY also contain revocation objects for any intermediate certificate authorities (CAs) between the voucher-issuer and the trust anchor known to the recipient. However, the use of CRLs and other validity mechanisms is discouraged, as the pledge is unlikely to be able to perform online checks, and is unlikely to have a trusted clock source. As described below, the use of short-lived vouchers and/or pledge provided nonce provides a freshness guarantee.

[6.3.1](#). COSE signing

The COSE-Sign1 structure discussed in [section 4.2 of \[RFC8152\]](#). The CBOR object that carries the body, the signature, and the information about the body and signature is called the COSE_Sign1 structure. It is used when only one signature is used on the body. The signature algorithm is ECSDA with three curves P-256, P-384, and P-512.

Support for EdDSA is encouraged.

Unlike with the CMS structure, the COSE-Sign1 structure does not provide a standard way for the signing keys to be included in the structure. This will not, in general, be a problem for the Pledge, as the key needed to verify the signature MUST be included at manufacturing time.

A problem arises for the Registrar: to verify the voucher, the Registrar must have access to the MASA's public key. This document does not specify how to transfer the relevant key.

7. Design Considerations

The design considerations for the CBOR encoding of vouchers is much the same as for [[RFC8366](#)].

One key difference is that the names of the leaves in the YANG does not have a material effect on the size of the resulting CBOR, as the SID translation process assigns integers to the names.

8. Security Considerations

8.1. Clock Sensitivity

TBD.

8.2. Protect Voucher PKI in HSM

TBD.

8.3. Test Domain Certificate Validity when Signing

TBD.

9. IANA Considerations

9.1. Resource Type Registry

Additions to the sub-registry "CoAP Resource Type", within the "CoRE parameters" registry are specified below. These can be registered either in the Expert Review range (0-255) or IETF Review range (256-9999).

ace.rt.rv needs registration with IANA
ace.rt.vs needs registration with IANA
ace.rt.es needs registration with IANA
ace.rt.ra needs registration with IANA

9.2. The IETF XML Registry

This document registers two URIs in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-constrained-voucher
 Registrant Contact: The ANIMA WG of the IETF.
 XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-constrained-voucher-request
 Registrant Contact: The ANIMA WG of the IETF.
 XML: N/A, the requested URI is an XML namespace.

9.3. The YANG Module Names Registry

This document registers two YANG modules in the YANG Module Names registry [RFC6020]. Following the format defined in [RFC6020], the the following registration is requested:

```

name:          ietf-constrained-voucher
namespace:    urn:ietf:params:xml:ns:yang:ietf-constrained-voucher
prefix:       vch
reference:    RFC XXXX

name:          ietf-constrained-voucher-request
namespace:    urn:ietf:params:xml:ns:yang:ietf-constrained
              -voucher-request
prefix:       vch
reference:    RFC XXXX

```

9.4. The SMI Security for S/MIME CMS Content Type Registry

This document registers an OID in the "SMI Security for S/MIME CMS Content Type" registry (1.2.840.113549.1.9.16.1), with the value:

Decimal	Description	References
TBD1	id-ct-animaCBORVoucher	[ThisRFC]

EDNOTE: should a separate value be used for Voucher Requests?

9.5. The SID registry

The SID range 1001100 was allocated by comi.space to the IETF-CONSTRAINED-VOUCHER yang module.

The SID range 1001150 was allocated by comi.space to the IETF-CONSTRAINED-VOUCHER-REQUEST yang module.

EDNOTE: it is unclear if there is further IANA work required.

9.6. Media-Type Registry

This section registers the 'application/voucher-cms+cbor' media type and the 'application/voucher-cose+cbor' in the "Media Types" registry. These media types are used to indicate that the content is a CBOR voucher either signed with a cms structure or a COSE_Sign1 structure [[RFC8152](#)].

9.6.1. application/voucher-cms+cbor

Type name: application
Subtype name: voucher-cms+cbor
Required parameters: none
Optional parameters: none
Encoding considerations: CMS-signed CBOR vouchers are CBOR encoded.
Security considerations: See Security Considerations, Section
Interoperability considerations: The format is designed to be broadly interoperable.
Published specification: THIS RFC.
Applications that use this media type: ANIMA, 6tisch, and other zero-touch imprinting systems
Additional information:
 Magic number(s): None
 File extension(s): .vch
 Macintosh file type code(s): none
Person & email address to contact for further information: IETF ANIMA WG
Intended usage: LIMITED
Restrictions on usage: NONE
Author: ANIMA WG
Change controller: IETF
Provisional registration? (standards tree only): NO

9.6.2. application/voucher-cose+cbor

Type name: application
 Subtype name: voucher-cose+cbor
 Required parameters: none
 Optional parameters: cose-type
 Encoding considerations: COSE_Sign1 CBOR vouchers are COSE objects signed with one signer.
 Security considerations: See Security Considerations, Section
 Interoperability considerations: The format is designed to be broadly interoperable.
 Published specification: THIS RFC.
 Applications that use this media type: ANIMA, 6tisch, and other zero-touch imprinting systems
 Additional information:
 Magic number(s): None
 File extension(s): .vch
 Macintosh file type code(s): none
 Person & email address to contact for further information: IETF ANIMA WG
 Intended usage: LIMITED
 Restrictions on usage: NONE
 Author: ANIMA WG
 Change controller: IETF
 Provisional registration? (standards tree only): NO

9.7. CoAP Content-Format Registry

Additions to the sub-registry "CoAP Content-Formats", within the "CoRE Parameters" registry are needed for two media types. These can be registered either in the Expert Review range (0-255) or IETF Review range (256-9999).

Media type	mime type	Encoding	ID	References
application/voucher-cms+cbor	- -	CBOR	TBD2	[This RFC]
application/voucher-cose+cbor	"COSE-Sign1"	CBOR	TBD3	[This RFC]

10. Acknowledgements

We are very grateful to Jim Schaad for explaining COSE and CMS choices.

Michel Veillette did extensive work on pyang to extend it to support the SID allocation process, and this document was among the first users.

We are grateful for the suggestions done by Esko Dijk.

11. Changelog

-02

Example of requestvoucher with unsigned application/cbor is added
attributes of voucher "refined" to optional
CBOR serialization of vouchers improved
Discovery port numbers are specified

-01

application/json is optional, application/cbor is compulsory
Cms and cose mediatypes are introduced

Appendix A. EST messages to EST-coaps

This section extends the examples from [Appendix A](#) of [\[I-D.ietf-ace-coap-est\]](#). The CoAP headers are only worked out for the enrollstatus example.

A.1. enrollstatus

A coaps enrollstatus message can be :

```
GET coaps://[192.0.2.1:8085]/est/es
```

The corresponding coap header fields are shown below.

```

Ver = 1
T = 0 (CON)
Code = 0x01 (0.01 is GET)
Options
Option1 (Uri-Host)
  Option Delta = 0x3 (option nr = 3)
  Option Length = 0x9
  Option Value = 192.0.2.1
Option2 (Uri-Port)
  Option Delta = 0x4 (option nr = 4+3=7)
  Option Length = 0x4
  Option Value = 8085
Option3 (Uri-Path)
  Option Delta = 0x4 (option nr = 7+4= 11)
  Option Length = 0x7
  Option Value = /est/es
Payload = [Empty]

```

A 2.05 Content response with an unsigned JSON voucher (ct=50) will then be:

```

2.05 Content (Content-Format: application/json)
  {payload}

```

With CoAP fields and payload:

```

Ver=1
T=2 (ACK)
Code = 0x45 (2.05 Content)
Options
  Option1 (Content-Format)
    Option Delta = 0xC (option nr 12)
    Option Length = 0x2
    Option Value = 0x32 (application/json)

  Payload =
  [EDNOTE: put here voucher payload ]

```

[A.2.](#) voucher_status

A coaps voucher_status message can be :

```

GET coaps://[2001:db8::2:1]:61616]/est/vs

```

A 2.05 Content response with a non signed CBOR voucher (ct=60) will then be:

2.05 Content (Content-Format: application/cbor)
Payload =
[EDNOTE: put here voucher payload]

A.3. requestvoucher

Two request-voucher request payloads are possible from pledge to Registrar, a signed one and an unsigned one, as explained in Section 5.2 of [[I-D.ietf-anima-bootstrapping-keyinfra](#)].

A.3.1. signed requestvoucher

A coaps signed requestvoucher message from RA to MASA can be :

POST coaps://[2001:db8::2:1]:61616]/est/rv

A 2.04 Changed response returning CBOR voucher signed with a cms structure(ct=TBD2) will then be:

2.04 Changed (Content-Format: application/voucher-cms+cbor)
Payload =
[EDNOTE: put here encrypted voucher payload]

A.3.2. unsigned requestvoucher

A coaps unsigned requestvoucher message from pledge to Registrar can be :

POST coaps://[2001:db8::2:1]:61616]/est/rv

A 2.04 Changed response returning CBOR voucher (ct=60) will then be:

2.04 Changed (Content-Format: application/cbor)
Payload =
[EDNOTE: put here encrypted voucher payload]

A.4. requestauditing

A coaps requestauditing message can be :

GET coaps://[2001:db8::2:1]:61616]/est/ra

A 2.05 Content response returning a COSE_Sign1 object (ct=TBD3) will then be:

2.05 Content (Content-Format: application/voucher-cose+cbor)
Payload =
[EDNOTE: put here COSE_Sign1 voucher payload]
