## Abstract

Speex is an open-source voice codec suitable for use in Voice over IP (VoIP) type applications. This document describes the payload format for Speex generated bit streams within an RTP packet. Also included here are the necessary details for the use of Speex with the Session Description Protocol (SDP).

## Editors Note

All references to RFC XXXX are to be replaced by references to the RFC number of this memo, when published.

## **1. Introduction**

Speex is based on the CELP [[CELP](#)] encoding technique with support for either narrowband (nominal 8kHz), wideband (nominal 16kHz) or ultra-wideband (nominal 32kHz). The main characteristics can be summarized as follows:

- o Free software/open-source
- o Integration of wideband and narrowband in the same bit-stream
- o Wide range of bit-rates available
- o Dynamic bit-rate switching and variable bit-rate (VBR)
- o Voice Activity Detection (VAD, integrated with VBR)
- o Variable complexity

The Speex codec supports a wide range of bit-rates from 2.15 kbit/s to 44 kbit/s. In some cases however, it may not be possible for an implementation to include support for all rates (e.g. because of bandwidth, RAM or CPU constraints). In those cases, to be compliant with this specification, implementations **MUST** support at least narrowband (8 kHz) encoding and decoding at 8 kbit/s bit-rate (narrowband mode 3). Support for narrowband at 15 kbit/s (narrowband mode 5) is **RECOMMENDED** and support for wideband at 27.8 kbit/s (wideband mode 8) is also **RECOMMENDED**. The sampling rate **MUST** be 8, 16 or 32 kHz.

## **2. Terminology**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119](#) [[RFC2119](#)] and indicate requirement levels for compliant RTP implementations.

### 3. RTP usage for Speex

#### 3.1. RTP Speex Header Fields

The RTP header is defined in the RTP specification [[RFC3550](#)]. This section defines how fields in the RTP header are used.

**Payload Type (PT):** The assignment of an RTP payload type for this packet format is outside the scope of this document; it is specified by the RTP profile under which this payload format is used, or signaled dynamically out-of-band (e.g., using SDP).

**Marker (M) bit:** The M bit is set to one on the first packet sent after a silence period, during which packets have not been transmitted contiguously.

**Extension (X) bit:** Defined by the RTP profile used.

**Timestamp:** A 32-bit word that corresponds to the sampling instant for the first frame in the RTP packet.

#### 3.2. RTP payload format for Speex

The RTP payload for Speex has the format shown in Figure 1. No additional header fields specific to this payload format are required. For RTP based transportation of Speex encoded audio the standard RTP header [[RFC3550](#)] is followed by one or more payload data blocks. An optional padding terminator may also be used.

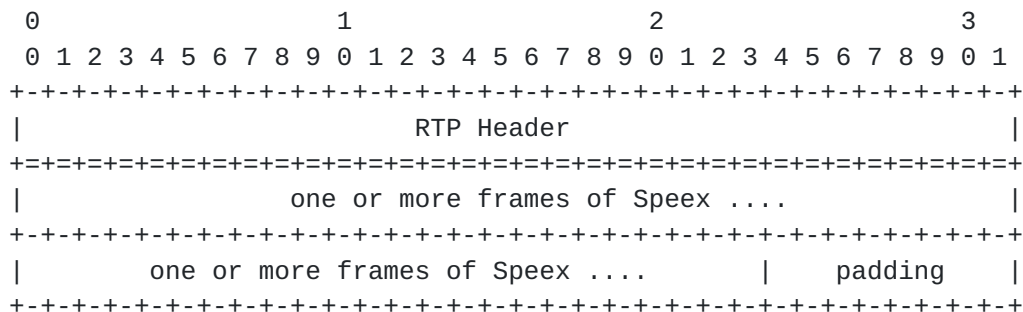

Figure 1: RTP payload for Speex

#### 3.3. Speex payload

For the purposes of packetizing the bit stream in RTP, it is only necessary to consider the sequence of bits as output by the Speex encoder [[speex manual](#)], and present the same sequence to the decoder. The payload format described here maintains this sequence.

A typical Speex frame, encoded at the maximum bitrate, is approx. 110 octets and the total number of Speex frames SHOULD be kept less than the path MTU to prevent fragmentation. Speex frames MUST NOT be fragmented across multiple RTP packets,

An RTP packet MAY contain Speex frames of the same bit rate or of varying bit rates, since the bit-rate for a frame is conveyed in band with the signal.

The encoding and decoding algorithm can change the bit rate at any 20 msec frame boundary, with the bit rate change notification provided in-band with the bit stream. Each frame contains both sampling rate (narrowband, wideband or ultra-wideband) and "mode" (bit-rate) information in the bit stream. No out-of-band notification is required for the decoder to process changes in the bit rate sent by the encoder.

The sampling rate MUST be either 8000 Hz, 16000 Hz, or 32000 Hz.

The RTP payload MUST be padded to provide an integer number of octets as the payload length. These padding bits are LSB aligned in network octet order and consist of a 0 followed by all ones (until the end of the octet). This padding is only required for the last frame in the packet, and only to ensure the packet contents ends on an octet boundary.

### 3.4. Example Speex packet

In the example below we have a single Speex frame with 5 bits of padding to ensure the packet size falls on an octet boundary.

```

      0              1              2              3
    0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|                                     RTP Header                                     |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|                                     ..speex data..                               |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|                                     ..speex data..                               |0 1 1 1 1|
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

### 3.5. Multiple Speex frames in a RTP packet

Below is an example of two Speex frames contained within one RTP packet. The Speex frame length in this example fall on an octet boundary so there is no padding.

The Speex decoder [[speex\\_manual](#)] can detect the bitrate from the

payload and is responsible for detecting the 20 msec boundaries between each frame.

[illegible]

## **4. IANA Considerations**

This document defines the Speex media type.

### **4.1. Media Type Registration**

This section describes the media types and names associated with this payload format. The section registers the media types, as per [RFC4288](#) [[RFC4288](#)]

#### **4.1.1. Registration of media type audio/speex**

Media type name: audio

Media subtype name: speex

Required parameters:

rate: RTP timestamp clock rate, which is equal to the sampling rate in Hz. The sampling rate MUST be either 8000, 16000, or 32000.

Optional parameters:

ptime: SHOULD be a multiple of 20 msec [[RFC4566](#)]

maxptime: SHOULD be a multiple of 20 msec [[RFC4566](#)]

vbr: variable bit rate - either 'on' 'off' or 'vad' (defaults to off). If on, variable bit rate is enabled. If off, disabled. If set to 'vad' then constant bit rate is used but silence will be encoded with special short frames to indicate a lack of voice for that period.

cng: comfort noise generation - either 'on' or 'off'. If off then silence frames will be silent; if 'on' then those frames will be filled with comfort noise.

mode: List supported Speex decoding modes. The valid modes are different for narrowband and wideband, and are defined as follows:

\* {1,2,3,4,5,6,7,8,any} for narrowband

\* {0,1,2,3,4,5,6,7,8,9,10,any} for wideband and ultra-wideband

Several 'mode' parameters can be provided. In this case, the

remote party SHOULD configure its encoder using the first supported mode provided. When 'any' is used, the offerer indicates that it supports all decoding modes. If the 'mode' parameter is not provided, the mode value is considered to be equivalent to 'mode=3;mode=any' in narrowband and 'mode=8;mode=any' in wideband and ultra-wideband. Note that each Speex frame does contains the mode (or bit-rate) that should be used to decode it. Thus application MUST be able to decode any Speex frame unless the SDP clearly specify that some modes are not supported. (e.g., by not including 'mode=any')

Encoding considerations:

This media type is framed and binary, see [section 4.8 in \[RFC4288\]](#).

Security considerations: See [Section 6](#)

Interoperability considerations:

None.

Published specification:

RFC XXXX [RFC Editor: please replace by the RFC number of this memo, when published]

Applications which use this media type:

Audio streaming and conferencing applications.

Additional information: none

Person and email address to contact for further information :

Alfred E. Heggstad: aeh@db.org

Intended usage: COMMON

Restrictions on usage:

This media type depends on RTP framing, and hence is only defined for transfer via RTP [[RFC3550](#)]. Transport within other framing protocols is not defined at this time.

Author: Alfred E. Heggstad

Change controller:

IETF Audio/Video Transport working group delegated from the IESG.

## 5. SDP usage of Speex

The information carried in the media type specification has a specific mapping to fields in the Session Description Protocol (SDP) [[RFC4566](#)], which is commonly used to describe RTP sessions. When SDP is used to specify sessions employing the Speex codec, the mapping is as follows:

- o The media type ("audio") goes in SDP "m=" as the media name.
- o The media subtype ("speex") goes in SDP "a=rtpmap" as the encoding name. The required parameter "rate" also goes in "a=rtpmap" as the clock rate.
- o The parameters "ptime" and "maxptime" go in the SDP "a=ptime" and "a=maxptime" attributes, respectively.
- o Any remaining parameters go in the SDP "a=fmtp" attribute by copying them directly from the media type string as a semicolon separated list of parameter=value pairs.

The tables below include the equivalence between modes and bitrates for narrowband, wideband and ultra-wideband. Also, the corresponding "Speex quality" setting (see SPEEX\_SET\_QUALITY in The Speex Codec Manual [[speex\\_manual](#)]) is included as an indication.

mode	Speex quality	bitrate
1	0	2.15 kbit/s
2	2	5.95 kbit/s
3	3 or 4	8.00 kbit/s
4	5 or 6	11.0 kbit/s
5	7 or 8	15.0 kbit/s
6	9	18.2 kbit/s
7	10	24.6 kbit/s
8	1	3.95 kbit/s

Mode vs Bitrate table for narrowband

Table 1

mode	Speex quality	wideband bitrate	ultra wideband bitrate
0	0	3.95 kbit/s	5.75 kbit/s
1	1	5.75 kbit/s	7.55 kbit/s
2	2	7.75 kbit/s	9.55 kbit/s
3	3	9.80 kbit/s	11.6 kbit/s
4	4	12.8 kbit/s	14.6 kbit/s
5	5	16.8 kbit/s	18.6 kbit/s
6	6	20.6 kbit/s	22.4 kbit/s
7	7	23.8 kbit/s	25.6 kbit/s
8	8	27.8 kbit/s	29.6 kbit/s
9	9	34.2 kbit/s	36.0 kbit/s
10	10	42.2 kbit/s	44.0 kbit/s

Mode vs Bitrate table for wideband and ultra-wideband

Table 2

The Speex parameters indicate the decoding capabilities of the agent, and what the agent prefers to receive.

The Speex parameters in an SDP Offer/Answer exchange are completely orthogonal, and there is no relationship between the SDP Offer and the Answer.

Several Speex specific parameters can be given in a single a=fmtp line provided that they are separated by a semi-colon:

```
a=fmtp:97 mode=1;mode=any;vbr=on
```

Some example SDP session descriptions utilizing Speex encodings follow.

### **5.1. Example supporting all modes, prefer mode 4**

The offerer indicates that it wishes to receive a Speex stream at 8000Hz, and wishes to receive Speex 'mode 4'. It is important to understand that any other mode might still be sent by remote party: the device might have bandwidth limitation or might only be able to send 'mode=3'. Thus, application that support all decoding modes SHOULD include 'mode=any' as shown in the example below:

```
m=audio 8088 RTP/AVP 97
a=rtpmap:97 speex/8000
a=fmtp:97 mode=4;mode=any
```

### **5.2. Example supporting only mode 3 and 5**

The offerer indicates the mode he wishes to receive (Speex 'mode 3'). This offer indicates mode 3 and mode 5 are supported and that no other modes are supported. The remote party MUST NOT configure its encoder using another Speex mode.

```
m=audio 8088 RTP/AVP 97
a=rtpmap:97 speex/8000
a=fmtp:97 mode=3;mode=5
```

### **5.3. Example with Variable Bit Rate and Comfort Noise**

The offerer indicates that it wishes to receive variable bit rate frames with comfort noise:

```
m=audio 8088 RTP/AVP 97
a=rtpmap:97 speex/8000
a=fmtp:97 vbr=on;cng=on
```

### **5.4. Example with Voice Activity Detection**

The offerer indicates that it wishes to use silence suppression. In this case vbr=vad parameter will be used:

```
m=audio 8088 RTP/AVP 97
a=rtpmap:97 speex/8000
a=fmtp:97 vbr=vad
```

### **5.5. Example with Multiple sampling rates**

The offerer indicates that it wishes to receive Speex audio at 16000 Hz with mode 10 (42.2 kbit/s), alternatively Speex audio at 8000 Hz with mode 7 (24.6 kbit/s). The offerer supports decoding all modes.

```
m=audio 8088 RTP/AVP 97 98
a=rtpmap:97 speex/16000
a=fmtp:97 mode=10;mode=any
a=rtpmap:98 speex/8000
a=fmtp:98 mode=7;mode=any
```

#### **5.6. Example withptime and Multiple Speex frames**

The "ptime" attribute is used to denote the packetization interval (ie, how many milliseconds of audio is encoded in a single RTP packet). Since Speex uses 20 msec frames, ptime values of multiples of 20 denote multiple Speex frames per packet. Values of ptime which are not multiples of 20 MUST be rounded up to the first multiple of 20 above the ptime value.

In the example below the ptime value is set to 40, indicating that there are 2 frames in each packet.

```
m=audio 8088 RTP/AVP 97
a=rtpmap:97 speex/8000
a=ptime:40
```

Note that the ptime parameter applies to all payloads listed in the media line and is not used as part of an a=fmtp directive.

Care must be taken when setting the value of ptime so that the RTP packet size does not exceed the path MTU.

#### **5.7. Example with Complete Offer/Answer exchange**

The offerer indicates that it wishes to receive Speex audio at 16000 Hz, alternatively Speex audio at 8000 Hz. The offerer does support ALL modes because no mode is specified.

```
m=audio 8088 RTP/AVP 97 98
a=rtpmap:97 speex/16000
a=rtpmap:98 speex/8000
```

The answerer indicates that it wishes to receive Speex audio at 8000 Hz, which is the only sampling rate it supports. The answerer does support ALL modes because no mode is specified.

```
m=audio 8088 RTP/AVP 99
a=rtpmap:99 speex/8000
```

## **6. Implementation Guidelines**

Implementations that supports Speex are responsible for correctly decoding incoming Speex frames.

Each Speex frame does contains all needed informations to decode itself. In particular, the 'mode' and 'ptime' values proposed in the SDP contents **MUST NOT** be used for decoding: those values are not needed to properly decode a RTP Speex stream.

## **7. Security Considerations**

RTP packets using the payload format defined in this specification are subject to the security considerations discussed in the RTP specification [[RFC3550](#)], and any appropriate RTP profile. This implies that confidentiality of the media streams is achieved by encryption. Because the data compression used with this payload format is applied end-to-end, encryption may be performed after compression so there is no conflict between the two operations.

A potential denial-of-service threat exists for data encodings using compression techniques that have non-uniform receiver-end computational load. The attacker can inject pathological datagrams into the stream which are complex to decode and cause the receiver to be overloaded. However, this encoding does not exhibit any significant non-uniformity.

As with any IP-based protocol, in some circumstances a receiver may be overloaded simply by the receipt of too many packets, either desired or undesired. Network-layer authentication may be used to discard packets from undesired sources, but the processing cost of the authentication itself may be too high.

## **8. Acknowledgements**

The authors would like to thank Equivalence Pty Ltd of Australia for their assistance in attempting to standardize the use of Speex in H.323 applications, and for implementing Speex in their open source OpenH323 stack. The authors would also like to thank Brian C. Wiles <brian@streamcomm.com> of StreamComm for his assistance in developing the proposed standard for Speex use in H.323 applications.

The authors would also like to thank the following members of the Speex and AVT communities for their input: Ross Finlayson, Federico Montesino Pouzols, Henning Schulzrinne, Magnus Westerlund, Colin Perkins, Ivo Emanuel Goncalves.

Thanks to former authors of this document; Simon Morlat, Roger Hardiman, Phil Kerr.

## **9. Copying conditions**

The authors agree to grant third parties the irrevocable right to copy, use and distribute the work, with or without modification, in any medium, without royalty, provided that, unless separate permission is granted, redistributed modified works do not contain misleading author, version, name of work, or endorsement information.
