The ARIA Algorithm and Its Use with the Secure Real-time Transport Protocol(SRTP)
draft-ietf-avtcore-aria-srtp-04

Abstract

This document describes the use of the ARIA block cipher algorithm within the Secure Real-time Transport Protocol (SRTP) for providing confidentiality for the Real-time Transport Protocol (RTP) traffic and for the control traffic for RTP, the Real-time Transport Control Protocol (RTCP). It details three modes of operation (CTR, CCM, GCM) and a SRTP Key Derivation Function for ARIA.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 24, 2014.

1. Introduction

This document describes the use of the ARIA [[RFC5794](#)] block cipher algorithm in the Secure Real-time Transport Protocol (SRTP) [[RFC3711](#)]

Kim, et al.

Expires February 24, 2014

[Page 2]

for providing confidentiality for the Real-time Transport Protocol (RTP) [[RFC3550](#)] traffic and for the control traffic for RTP, the Real-time Transport Control Protocol (RTCP) [[RFC3550](#)].

[1.1.](#) ARIA

ARIA is a general-purpose block cipher algorithm developed by Korean cryptographers in 2003. It is an iterated block cipher with 128-, 192-, and 256-bit keys and encrypts 128-bit blocks in 12, 14, and 16 rounds, depending on the key size. It is secure and suitable for most software and hardware implementations on 32-bit and 8-bit processors. It was established as a Korean standard block cipher algorithm in 2004 [[ARIAKS](#)] and has been widely used in Korea, especially for government-to-public services. It was included in PKCS #11 in 2007 [[ARIAPKCS](#)]. The algorithm specification and object identifiers are described in [[RFC5794](#)].

[1.2.](#) Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

[2.](#) Cryptographic Transforms

Block ciphers ARIA and AES share common characteristics including mode, key size, and block size. ARIA does not have any restrictions for modes of operation that are used with this block cipher. We define three modes of running ARIA within the SRTP protocol, (1) ARIA in Counter Mode (ARIA-CTR), (2) ARIA in Counter with CBC-MAC Mode (ARIA-CCM) and (3) ARIA in Galois/Counter Mode (ARIA-GCM).

[2.1.](#) ARIA-CTR

[Section 4.1.1 of \[RFC3711\]](#) defines AES-128 counter mode encryption, which it refers to as "AES_CM". [Section 2 of \[RFC6188\]](#) defines "AES_192_CM" and "AES_256_CM" in SRTP. ARIA counter modes are defined in the same manner except that each invocation of AES is replaced by that of ARIA, and are denoted by ARIA_128_CTR, ARIA_192_CTR and ARIA_256_CTR respectively, according to the key lengths. The plaintext inputs to the block cipher are formed as in AES-CTR(AES_CM, AES_192_CM, AES_256_CM) and the block cipher outputs are processed as in AES-CTR.

When ARIA-CTR is used, it MUST be used only in conjunction with an authentication function. The ARIA-CTR crypto suites with HMAC-SHA1 as an authentication function are listed below. The authentication key length of all crypto suites is 20 octets.

Kim, et al.

2.2. ARIA-GCM

GCM(Galois Counter Mode) [[GCM](#)][RFC5116] is a AEAD(authenticated encryption with associated data) block cipher mode. A detailed description of ARIA-GCM is defined similarly as AES-GCM found in [[RFC5116](#)][RFC5282].

The internet draft [[I-D.ietf-avtcore-srtp-aes-gcm](#)] describes the use of AES-GCM with SRTP. The use of ARIA-GCM with SRTP is defined the same as that of AES-GCM except that each invocation of AES is replaced by ARIA.

The ARIA-GCM algorithms in Table 8 may be used with SRTP and SRTCP:

| Name | Enc. Key Length | Auth. Tag Length | |
|-------------------|-----------------|------------------|--|
| AEAD_ARIA_128_GCM | 16 octets | 16 octets | |
| AEAD_ARIA_256_GCM | 32 octets | 16 octets | |

[Page 8]

[2.3. ARIA-CCM](#)

CCM(Counter with CBC-MAC) [[RFC3610](#)][[RFC5116](#)] is another AEAD block cipher mode. A detailed description of ARIA-CCM is defined similarly as AES-CCM found in [[RFC5116](#)] [[RFC6655](#)] [[I-D.ietf-avtcore-srtp-aes-gcm](#)].

The internet draft [[I-D.ietf-avtcore-srtp-aes-gcm](#)] describes the use of AES-CCM with SRTP. The use of ARIA-CCM with SRTP is defined the same as that of AES-CCM except that each invocation of AES is replaced by ARIA.

The ARIA-CCM algorithms in Table 15 may be used with SRTP and SRTCP:

| Name | Enc. Key Length | Auth. Tag Length |
|----------------------|-----------------|------------------|
| AEAD_ARIA_128_CCM | 16 octets | 16 octets |
| AEAD_ARIA_256_CCM | 32 octets | 16 octets |
| AEAD_ARIA_128_CCM_8 | 16 octets | 8 octets |
| AEAD_ARIA_256_CCM_8 | 32 octets | 8 octets |
| AEAD_ARIA_128_CCM_12 | 16 octets | 12 octets |
| AEAD_ARIA_256_CCM_12 | 32 octets | 12 octets |

Table 15: ARIA-CCM Crypto Suites for SRTP/SRTCP

The parameters (from Table 16 to Table 21) in each crypto suite listed in Table 15 are described for use with the SDP Security Descriptions attributes [[RFC4568](#)].

| Parameter | Value |
|--------------------------------|--|
| Master key length | 128 bits |

Table 21: The AEAD_ARIA_256_CCM_12 Crypto Suite

3. Key Derivation Functions

[Section 4.3.3 of \[RFC3711\]](#) defines the AES-128 counter mode key derivation function, which it refers to as "AES-CM PRF". [Section 3 of \[RFC6188\]](#) defines the AES-192 counter mode key derivation function and the AES-256 counter mode key derivation function, which it refers to as "AES_192_CM_PRF" and "AES_256_CM_PRF" respectively. The ARIA-CTR PRF is defined in a same manner except that each invocation of AES replaced by that of ARIA. According to the key lengths of underlying encryption algorithm, ARIA-CTR PRFs are denoted by "ARIA_128_CTR_PRF", "ARIA_192_CTR_PRF" and "ARIA_256_CTR_PRF". The usage requirements of [\[RFC6188\]](#)[I-D.ietf-avtcore-srtp-aes-gcm] regarding the AES-CM PRF apply to the ARIA-CTR PRF as well. The PRFs for ARIA crypto suites with SRTP are defined by ARIA-CTR PRF of the equal key length with the encryption algorithm (see [Section 2](#)). SRTP_ARIA_128_CTR_HMAC, SRTP_AEAD_ARIA_128_GCM, and SRTP_AEAD_ARIA_128_CCM MUST use the ARIA_128_CTR_PRF Key Derivation Function. SRTP_ARIA_192_CTR_HMAC MUST use that ARIA_192_CTR_PRF Key Derivation Function. And SRTP_ARIA_256_CTR_HMAC, SRTP_AEAD_ARIA_256_GCM, and SRTP_AEAD_ARIA_256_CCM MUST use the ARIA_256_CTR_PRF Key Derivation Function.

4. Security Considerations

At the time of writing this document no security problem has been found on ARIA (see [\[TSL\]](#)).

The security considerations in [\[RFC3610\]](#) [\[GCM\]](#) [\[RFC3711\]](#) [\[RFC5116\]](#) [\[RFC6188\]](#) [[I-D.ietf-avtcore-srtp-aes-gcm](#)] apply to this document as

Kim, et al.

Expires February 24, 2014

[Page 11]

well. Ciphersuites with short tag length may be considered for specific application environments stated in 7.5 of [[RFC3711](#)], but the risk of weak authentication described in [Section 9.5.1 of \[RFC3711\]](#) should be taken into account.

5. IANA Considerations

5.1. SDES

Security description [[RFC4568](#)] defines SRTP "crypto suites". In order to allow SDP to signal the use of the algorithms defined in this document, IANA is requested to add the below crypto suites to the "SRTP Crypto Suite Registrations" created by [[RFC4568](#)], at time of writing located on the following IANA page: <http://www.iana.org/assignments/sdp-security-descriptions/sdp-security-descriptions.xml#sdp-security-descriptions-3> [1]

```
srtp-crypto-suite-ext = "ARIA_128_CTR_HMAC_SHA1_80"/
                        "ARIA_128_CTR_HMAC_SHA1_32"/
                        "ARIA_192_CTR_HMAC_SHA1_80"/
                        "ARIA_192_CTR_HMAC_SHA1_32"/
                        "ARIA_256_CTR_HMAC_SHA1_80"/
                        "ARIA_256_CTR_HMAC_SHA1_32"/
                        "AEAD_ARIA_128_GCM"      /
                        "AEAD_ARIA_256_GCM"      /
                        "AEAD_ARIA_128_GCM_8"    /
                        "AEAD_ARIA_256_GCM_8"    /
                        "AEAD_ARIA_128_GCM_12"   /
                        "AEAD_ARIA_256_GCM_12"   /
                        "AEAD_ARIA_128_CCM"     /
                        "AEAD_ARIA_256_CCM"     /
                        "AEAD_ARIA_128_CCM_8"   /
                        "AEAD_ARIA_256_CCM_8"   /
                        "AEAD_ARIA_128_CCM_12"  /
                        "AEAD_ARIA_256_CCM_12"  /
                        srtp-crypto-suite-ext
```

5.2. DTLS-SRTP

DTLS-SRTP [[RFC5764](#)] defines a DTLS-SRTP "SRTP Protection Profile". In order to allow the use of the algorithms defined in this document in DTLS-SRTP, IANA is requested to add the below crypto suite to the "DTLS-SRTP Protection Profiles" created by [[RFC5764](#)], at time of writing located on the following IANA page: <http://www.iana.org/assignments/srtp-protection/srtp-protection.xml#srtp-protection-1> [2].

```

The following list indicates the SRTP transform parameters for each protection profile. The parameters `cipher_key_length`, `cipher_salt_length`, `auth_key_length`, and `auth_tag_length` express the number of bits in the values to which they refer. The `maximum_lifetime` parameter indicates the maximum number of packets that can be protected with each single set of keys when the parameter profile is in use. All of these parameters apply to both RTP and RTCP, unless the RTCP parameters are separately specified.

Note that these SRTP Protection Profiles do not specify an auth_function, auth_key_length, or auth_tag_length because all of these profiles use AEAD algorithms, and thus do not use a separate auth_function, auth_key, or auth_tag. The term aead_auth_tag_length is used to emphasize that this refers to the authentication tag

Kim, et al.

[Page 17]

provided by the AEAD algorithm and that this tag is not located in the authentication tag field provided by SRTP/SRTCP.

5.3. MIKEY

[RFC3830] and [RFC5748] define encryption algorithms and PRFs for the SRTP policy in MIKEY. In order to allow the use of the algorithms defined in this document in MIKEY, IANA is requested to add the below crypto suites to the "MIKEY Security Protocol Parameters SRTP Type 0 (Encryption algorithm)" and to add the below PRF to the "MIKEY Security Protocol Parameters SRTP Type 5 (Pseudo Random Function)" created by [RFC3830], at time of writing located on the following IANA page <http://www.iana.org/assignments/mikey-payloads/mikey-payloads.xml#mikey-payloads-26> [3].

| SRTP Enc. alg | Value |
|---------------|-------|
| ARIA-CTR | TBD |
| ARIA-CCM | TBD |
| ARIA-GCM | TBD |

Default session encryption key length is 16 octets.

| SRTP PRF | Value |
|----------|-------|
| ARIA-CTR | TBD |

MIKEY specifies the algorithm family separately from the key length (which is specified by the Session Encryption key length) and the authentication tag length.

| | Encryption Algorithm | Encryption Key Length | Auth. Tag Length | |
|---------------------------|-------------------------|--------------------------|---------------------|--|
| SRTP_ARIA_128_CTR_HMAC_80 | ARIA-CTR | 16 octets | 10 octets | |
| SRTP_ARIA_128_CTR_HMAC_32 | ARIA-CTR | 16 octets | 4 octets | |
| SRTP_ARIA_192_CTR_HMAC_80 | ARIA-CTR | 24 octets | 10 octets | |
| SRTP_ARIA_192_CTR_HMAC_32 | ARIA-CTR | 24 octets | 4 octets | |
| SRTP_ARIA_256_CTR_HMAC_80 | ARIA-CTR | 32 octets | 10 octets | |
| SRTP_ARIA_256_CTR_HMAC_32 | ARIA-CTR | 32 octets | 4 octets | |

Figure 1: Mapping MIKEY parameters to ARIA-CTR with HMAC algorithm

| | Encryption Algorithm | Encryption Key Length | AEAD Auth. Tag Length |
|---------------------------|-------------------------|--------------------------|--------------------------|
| SRTP_AEAD_ARIA_128_GCM | ARIA-GCM | 16 octets | 16 octets |
| SRTP_AEAD_ARIA_128_CCM | ARIA-CCM | 16 octets | 16 octets |
| SRTP_AEAD_ARIA_128_GCM_12 | ARIA-GCM | 16 octets | 12 octets |
| SRTP_AEAD_ARIA_128_CCM_12 | ARIA-CCM | 16 octets | 12 octets |
| SRTP_AEAD_ARIA_128_GCM_8 | ARIA-GCM | 16 octets | 8 octets |
| SRTP_AEAD_ARIA_128_CCM_8 | ARIA-CCM | 16 octets | 8 octets |
| SRTP_AEAD_ARIA_256_GCM | ARIA-GCM | 32 octets | 16 octets |
| SRTP_AEAD_ARIA_256_CCM | ARIA-CCM | 32 octets | 16 octets |
| SRTP_AEAD_ARIA_256_GCM_12 | ARIA-GCM | 32 octets | 12 octets |
| SRTP_AEAD_ARIA_256_CCM_12 | ARIA-CCM | 32 octets | 12 octets |
| SRTP_AEAD_ARIA_256_GCM_8 | ARIA-GCM | 32 octets | 8 octets |

The length of encrypted payload is larger than that of payload by 16 octets which the length of the tag from GCM. For other GCM ciphersuites with shorter tag length than 16 octets, test vectors can be obtained by truncation from ARIA-GCM test verctors.

[A.4. Key Derivation Test Vector](#)

This section provides test vectors for the default key derivation function, which uses ARIA in Counter Mode. In the following, we walk through the initial key derivation for the ARIA Counter Mode cipher, which requires a 16/24/32 octet session encryption key according to the session encryption key length and a 14 octet session salt, and an authentication function which requires a 94 octet session

authentication key. These values are called the cipher key, the cipher salt, and the auth key in the following. The test vectors are generated in the same way with the test vectors of key derivation functions in [[RFC3711](#)] and [[RFC6188](#)] but with each invocation of AES replaced with an invocation of ARIA.

[A.4.1. ARIA_128](#)

The inputs to the key derivation function are the 16 octet master key and the 14 octet master salt:

```
master key: e1f97a0d3e018be0d64fa32c06de4139
master salt: 0ec675ad498afeebb6960b3aabe6

index DIV kdr:          000000000000
label:                  00
master salt: 0ec675ad498afeebb6960b3aabe6
-----
xor:      0ec675ad498afeebb6960b3aabe6    (x, PRF input)

x*2^16:   0ec675ad498afeebb6960b3aabe60000 (ARIA-CTR input)

cipher key: dbd85a3c4d9219b3e81f7d942e299de4 (ARIA-CTR output)
```

ARIA-CTR crypto suite requires 14 octet cipher salt while ARIA-CCM and ARIA-GCM crypto suites require 12 octet cipher salt.

```
index DIV kdr:          000000000000
label:                  02

[A.4.3. ARIA_256](#)

The inputs to the key derivation function are the 32 octet master key and the 14 octet master salt:

```

master key: 0c5ffd37a11edc42c325287fc0604f2e
            3e8cd5671a00fe3216aa5eb105783b54
master salt: 0ec675ad498afeeb6960b3aabe6
-----
index DIV kdr:           00000000000000
label:                  00
master salt: 0ec675ad498afeeb6960b3aabe6
-----
xor:       0ec675ad498afeeb6960b3aabe6      (x, PRF input)

x*2^16:    0ec675ad498afeeb6960b3aabe60000 (ARIA-CTR input)

cipher key: 0649a09d93755fe9c2b2efba1cce930a (ARIA-CTR 1st output)
            f2e76ce8b77e4b175950321aa94b0cf4 (ARIA-CTR 2nd output)

```

Kim, et al.

Expires February 24, 2014

[Page 30]

ARIA-CTR cipher suite requires 14 octet cipher salt while ARIA-CCM and ARIA-GCM cipher suites require 12 octet cipher salt.

```

index DIV kdr:          000000000000
label:                  02
master salt: 0ec675ad498afeeb6960b3aabe6
-----
xor:      0ec675ad498afee9b6960b3aabe6      (x, PRF input)

x*2^16:   0ec675ad498afee9b6960b3aabe60000 (ARIA-CTR input)

                           194abaa8553a8eba8a413a340fc80a3d (ARIA-CTR output)

cipher salt: 194abaa8553a8eba8a413a340fc8      (ARIA-CTR cipher
suite)
                           194abaa8553a8eba8a413a34      (ARIA-CCM or
ARIA-GCM cipher suite)

index DIV kdr:          000000000000
label:                  01
master salt: 0ec675ad498afeeb6960b3aabe6
-----
xor:      0ec675ad498afeeab6960b3aabe6      (x, PRF input)

x*2^16:   0ec675ad498afeeab6960b3aabe60000 (ARIA-CTR input)

```

Below, the auth key is shown on the left, while the corresponding ARIA input blocks are shown on the right.
