Stream Control Transmission Protocol (SCTP) Network Address Translation <u>draft-ietf-behave-sctpnat-02.txt</u>

Abstract

Stream Control Transmission Protocol [RFC4960] provides a reliable communications channel between two end-hosts in many ways similar to TCP [RFC0793]. With the widespread deployment of Network Address Translators (NAT), specialized code has been added to NAT for TCP that allows multiple hosts to reside behind a NAT and yet use only a single globally unique IPv4 address, even when two hosts (behind a NAT) choose the same port numbers for their connection. This additional code is sometimes classified as Network Address and Port Translation or NAPT. To date, specialized code for SCTP has NOT yet been added to most NATs so that only pure NAT is available. The end result of this is that only one SCTP capable host can be behind a NAT.

This document describes an SCTP specific variant of NAT which provides similar features of NAPT in the single point and multi-point traversal scenario.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of <u>BCP 78</u> and <u>BCP 79</u>.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/lid-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on June 24, 2010.

Stewart, et al. Expires June 24, 2010 [Page 3]

1. Introduction

Stream Control Transmission Protocol [RFC4960] provides a reliable communications channel between two end-hosts in many ways similar to TCP [RFC0793]. With the widespread deployment of Network Address Translators (NAT), specialized code has been added to NAT for TCP that allows multiple hosts to reside behind a NAT and yet use only a single globally unique IPv4 address, even when two hosts (behind a NAT) choose the same port numbers for their connection. This additional code is sometimes classified as Network Address and Port Translation or NAPT. To date, specialized code for SCTP has NOT yet been added to most NATs so that only true NAT is available. The end result of this is that only one SCTP capable host can be behind a NAT.

This document proposes an SCTP specific variant NAT that provides the NAPT functionality without changing SCTP port numbers. The authors feel it is possible and desirable to make these changes for a number of reasons.

- o It is desirable for SCTP internal end-hosts on multiple platforms to be able to share a NAT's public IP address, much as TCP does today.
- o If a NAT does not need to change any data within an SCTP packet it will reduce the processing burden of NAT'ing SCTP by NOT needing to execute the CRC32c checksum required by SCTP.
- o Not having to touch the IP payload makes the processing of ICMP messages in NATs easier.

2. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

3. Terminology

For this discussion we will use several terms, which we will define and point out in a figure.

o Private-Address (Priv-Addr) - The private address that is known to the internal host.

- o Internal-Port (Int-Port) The port number that is in use by the host holding the Private-Address.
- o Internal-VTag (Int-VTag) The Verification Tag that the internal host has chosen for its communication. The VTag is a unique 32 bit tag that must accompany any incoming SCTP packet for this association to the Private-Address.
- o External-Address (Ext-Addr) The address that an internal host is attempting to contact.
- o External-Port (Ext-Port) The port number of the peer process at the External-Address.
- o External-VTag (Ext-VTag) The Verification Tag that the host holding the External-Address has chosen for its communication. The VTag is a unique 32 bit tag that must accompany any incoming SCTP packet for this association to the External-Address.
- o Public-Address (Pub-Addr) The public address assigned to the NAT box which it uses as a source address when sending packets towards the External-Address.

Internal N	letwork		External Netwo	rk	
	Private	Public		External	L
++	Address	Address	/\	Address	++
SCTP		++	/ \		SCTP
end point =	=======	= NAT =====	= Internet	=========	end point
A		++	\ /		B
++	Internal		\/\/	External	++
Internal	Port			Port	External
VTag					VTag

4. SCTP NAT Traversal Scenarios

This section defines the notion of single and multi-point NAT traversal.

4.1. Single Point Traversal

In this case, all packets in the SCTP association go through a single NAT, as shown below:

Internal Network	I	External Network	
++		/\	++
SCTP	++	/ \	SCTP
end point =======	== NAT ===	====== Internet =====	==== end point
A	++	\ /	B
++	I	\/\/	++

A variation of this case is shown below, i.e., multiple NATs in a single path:

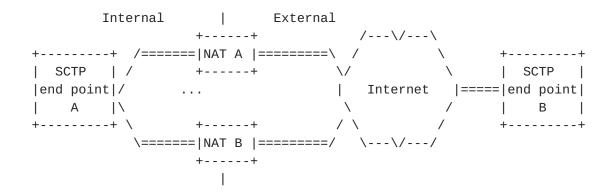

Internal	External	:: Inter	nal Exter	rnal	
	1	::	I		
++	I	::		/\	++
SCTP +	+	::	++	/ \	SCTP
end point === N	NAT =====	=::======	= NAT ==	Internet =	= end point
A +	+	::	++	\ /	B
++	1	::		\/\/	++
	1	::			

In this single point traversal scenario, we must acknowledge that while one of the main benefits of SCTP multi-homing is redundant paths, the NAT function represents a single point of failure in the path of the SCTP multi-home association. However, the rest of the path may still benefit from path diversity provided by SCTP multihoming.

The two SCTP endpoints in this case can be either single-homed or multi-homed. However, the important thing is that the NAT (or NATs) in this case sees ALL the packets of the SCTP association.

4.2. Multi Point Traversal

This case involves multiple NATs and each NAT only sees some of the packets in the SCTP association. An example is shown below:

This case does NOT apply to a single-homed SCTP association (i.e., BOTH endpoints in the association use only one IP address). The advantage here is that the existence of multiple NAT traversal points can preserve the path diversity of a multi-homed association for the entire path. This in turn can improve the robustness of the communication.

5. Limitations of classical NAPT for SCTP

Using classical NAPT may result in changing one of the SCTP port numbers during the processing which requires the recomputation of the transport layer checksum. Whereas for UDP and TCP this can be done very efficently, for SCTP the checksum (CRC32c) over the entire packet needs to be recomputed. This would add considerable to the NAT computational burden, however hardware support may mitigate this in some implementations.

An SCTP endpoint may have multiple addresses but only has a single port number. To make multipoint travesal work, all the NATs involved must recognize the packets they see as belonging to the same SCTP association and perform port number translation in a consistent way. One possible way of doing this is to use pre-defined table of ports and addresses configured within each NAT. Other mechanisms could make use of NAT to NAT communcation. Such mechanisms are considered by the authors to be undeployable on a wide scale base and thus not a recommended solution. Therefore the SCTP variant of NAT has been developed.

6. The SCTP specific variant of NAT

In this section we assume that we have multiple SCTP capable hosts behind a NAT which has one Public-Address. Furthermore we are focusing in this section on the single point traversal scenario.

The modification of SCTP packets sent to the public Internet is easy. The source address of the packet has to be replaced with the Public-Address. It may also be necessary to establish some state in the NAT box to handle incoming packets, which is discussed later.

For SCTP packets coming from the public Internet the destination address of the packets has to be replaced with the Private-Address of the host the packet has to be delivered to. The lookup of the Private-Address is based on the External-VTag, External-Port, External-Address, Internal-VTag and the Internal-Port.

For the SCTP NAT processing the NAT box has to maintain a table of

Internal-VTag, Internal-Port, Private-Address, External-VTag, External-Port and External-Address. An entry in that table is called a NAT state control block. The function Create() obtains the just mentioned parameters and returns a NAT-State control block.

The processing of outgoing SCTP packets containing an INIT-chunk is described in the following figure. The scenario shown is valid for all message flows in this section.

		/\/	\	
++	++	/	\	++
Host A <>	NAT <>	Interne	t <>	Host B
++	++	Λ	/	++
		\/\	-/	

INIT[Initiate-Tag] Priv-Addr:Int-Port ----> Ext-Addr:Ext-Port Ext-VTag=0

> Create(Initiate-Tag,Internal-Port,Private-Address, 0,External-Port,External-Address) Returns(NAT-State control block)

Translate To:

It should be noted that normally a NAT control block will be created. However, it is possible that there is already a NAT control block with the same External-Address, External-Port, Internal-Port, and Internal-VTag but different Private-Address. In this case the INIT SHOULD be dropped by the NAT and an ABORT SHOULD sent back to the SCTP host with the M-Bit set and an appropriate error cause [please see xxx-tsvwg-document-xx for the format] be sent back.

The processing of outgoing SCTP packets containing no INIT-chunk is described in the following figure.

Stewart, et al. Expires June 24, 2010 [Page 8]

Priv-Addr:Int-Port ----> Ext-Addr:Ext-Port Ext-VTag

Translate To:

Pub-Addr:Int-Port ----> Ext-Addr:Ext-Port Ext-VTag

The processing of incoming SCTP packets containing INIT-ACK chunks is described in the following figure. The Lookup() function getting as input the Internal-VTag, Internal-Port, External-VTag (=0), External-Port, and External-Address, returns the corresponding entry of the NAT table and updates the External-VTag by substituting it with the value of the Initiate-Tag of the INIT-ACK chunk. The wildcard character signifies that the parameter's value is not considered in the Lookup() function or changed in the Update() function, respectively.

		/\/	\	
++	++	/	λ	++
Host A <>	NAT <>	Interne	t <>	Host B
++	++	Λ	/	++
		\/\	-/	

INIT-ACK[Initiate-Tag] Pub-Addr:Int-Port <----- Ext-Addr:Ext-Port</pre> Int-VTag

Lookup(Internal-VTag,Internal-Port,*, 0, External-Port, External-Address) Update(*, *, *, Initiate-Tag, *, *)

Returns(NAT-State control block containing Private-Address)

INIT-ACK[Initiate-Tag] Priv-Addr:Int-Port <----- Ext-Addr:Ext-Port</pre> Int-VTaq

In the case Lookup fails, the SCTP packet is dropped. The Update routine inserts the External-VTag (the Initiate-Tag of the INIT-ACK chunk) in the NAT state control block.

Internet-Draft

SCTP Network Address Translation December 2009

The processing of incoming SCTP packets containing an ABORT or SHUTDOWN-COMPLETE chunk with the T-Bit set is described in the following figure.

/--\/--\ +----+ +----+ / \ +---+ | Host A | <-----> | NAT | <----> | Internet | <----> | Host B | +----+ +----+ \land / +---+ \--/\---/

> Pub-Addr:Int-Port <----- Ext-Addr:Ext-Port</pre> Ext-VTag

Lookup(0, Internal-Port, *,External-VTag, External-Port, External-Address)

Returns(NAT-State control block containing Private-Address)

Priv-Addr:Int-Port <----- Ext-Addr:Ext-Port</pre> Ext-VTag

The processing of other incoming SCTP packets is described in the following figure.

/--\/--\ +----+ +----+ / \ +---+ | Host A | <-----> | NAT | <----> | Internet | <----> | Host B | +---+ +---+ \land / +---+ \--/\---/

> Pub-Addr:Int-Port <---- Ext-Addr:Ext-Port</pre> Int-VTag

Lookup(Internal-VTag, Internal-Port, *, *, External-Port, External-Address)

Returns(NAT-State control block containing Local-Address)

Priv-Addr:Int-Port <----- Ext-Addr:Ext-Port</pre> Int-VTaq

For an incoming packet containing an INIT-chunk a table lookup is made only based on the addresses and port numbers. If an entry with an External-VTag of zero is found, it is considered a match and the External-VTag is updated.

This allows the handling of INIT-collision through NAT.

Internet-Draft SCTP Network Address Translation

7. Nat to SCTP

This document at various places discusses the sending of specialized SCTP chunks (e.g. an ABORT with M bit set). These chunks and proceedures are not defined in this document, but instead are defined in [xxxxx]. The NAT implementor should refer to [xxxx] for detailed descriptions of packet format and procedures.

8. Handling of fragmented SCTP packets

A NAT box MUST support IP reassembly of received fragmented SCTP packets. The fragments may arrive in any order.

When an SCTP packet has to be fragmented by the NAT box and the IP header forbids fragmentation a corresponding ICMP packet SHOULD be sent.

9. Simplification for small NATs

Small NAT boxes, i.e. NAT boxes which only have to support a small number of concurrent SCTP associations, MAY not take the external address into account when processing packets. Therefore the External-Address could also be removed from the NAT table.

This simplification may make implementing a NAT box easier, however, the collision probability is higher than using a mapping which takes the external address into account.

<u>10</u>. Various examples of NAT traversals

10.1. Single-homed client to single-homed server

The internal client starts the association with the external server via a four-way-handshake. Host A starts by sending an INIT chunk.

Stewart, et al. Expires June 24, 2010 [Page 11]

/--\ / \ +---+ +---+ +---+ | Host A | <-----> | NAT | <----> | Internet | <----> | Host B | +----+ +----+ \land / +---+ \--/\---/ +----+ | Int | Int | Priv | Ext | Ext | Ext NAT | VTag | Port | Addr | VTag | Port | Addr +----+

```
INIT[Initiate-Tag = 1234]
10.0.0.1:1 ----> 100.0.0.1:2
       Ext-VTtag = 0
```

A NAT entry is created, the source address is substituted and the packet is sent on:

NAT creates entry: | Int | Int | Priv | Ext | Ext | Ext NAT _____ | VTag | Port | Addr | VTag | Port | Addr | +----+ | 1234 | 1 | 10.0.0.1 | 0 | 2 | 100.0.0.1 |

> INIT[Initiate-Tag = 1234] 101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTtag = 0

Host B receives the INIT and sends an INIT-ACK with the NAT's external address as destination address.

Stewart, et al. Expires June 24, 2010 [Page 12]

```
INIT-ACK[Initiate-Tag = 5678]
101,0,0,1;1 <----- 100,0,0,1;2
                 Int-VTag = 1234
```

NAT updates entry:

	+-		· - + -		-+-	+	·		-+		+	- +
NAT	Ι	Int		Int		Priv		Ext	Ι	Ext	Ext	
		VTag		Port		Addr		VTag	Ι	Port	Addr	
	+-		- + -		-+-	+			-+		+	- +
	•		•		•	10.0.0.1			•			•
	+-		- + -		-+-	+			-+		+	-+

```
INIT-ACK[Initiate-Tag = 5678]
10.0.0.1:1 <----- 100.0.0.1:2
          Int-VTag = 1234
```

The handshake finishes with a COOKIE-ECHO acknowledged by a COOKIE-ACK.

```
/--\
                           /
                                 \
+---+
             +---+
                                           +---+
| Host A | <-----> | NAT | <----> | Internet | <----> | Host B |
+----+
              +---+
                           \land /
                                           +---+
                            \--/\---/
```

COOKIE-ECHO 10.0.0.1:1 ----> 100.0.0.1:2 Ext-VTag = 5678

> COOKIE-ECHO 101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTag = 5678

COOKIE-ACK

101.0.0.1:1 <----- 100.0.0.1:2 Int-VTag = 1234

COOKIE-ACK 10.0.0.1:1 <----- 100.0.0.1:2

Internet-Draft SCTP Network Address Translation December 2009

Int-VTag = 1234

10.2. Single-homed client to multi-homed server

The internal client is single-homed whereas the external server is multi-homed. The client (Host A) sends an INIT like in the singlehomed case.

+---+ /--\/--\ /-|Router 1| \setminus / \ / +----+ \ +----+ +---+ +---+ | Host | <----> | NAT | <-> | Internet | == ==| Host | \ / \ +----+ / | B | +---+ \--/\--/ \-|Router 2|-/ +----+ +---+ +---+ | Int | Int | Priv | Ext | Ext | Ext NAT | VTag | Port | Addr | VTag | Port | Addr | INIT[Initiate-Tag = 1234] 10.0.0.1:1 - - > 100.0.0.1:2Ext-VTag = 0NAT creates entry: NAT | Int | Int | Priv | Ext | Ext | Ext | | VTag | Port | Addr | VTag | Port | Addr | 1234 | 1 | 10.0.0.1 | 0 | 2 | 100.0.0.1 | +----+ INIT[Initiate-Tag = 1234] 101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTag = 0

The server (Host B) includes its two addresses in the INIT-ACK chunk, which results in two NAT entries.

Stewart, et al. Expires June 24, 2010 [Page 14]

+---+ /--\/--\ /-|Router 1| \ +----+ +----+ / \ / +----+ \ +----+ | Host | <----> | NAT | <-> | Internet | == ==| Host | \ / \ +----+ / | B | \--/\--/ \-|Router 2|-/ +----+ | A | +---+ +---+ +---+

> INIT-ACK[Initiate-tag = 5678, IP-Addr = 100.1.0.1] 101.0.0.1:1 <----- 100.0.0.1:2 Int-VTag = 1234

NAT updates first entry and creates entry for second address:

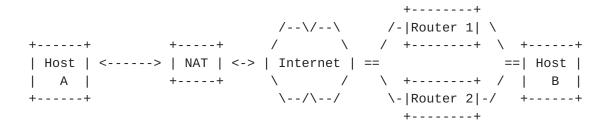

NAT

Int VTag	Int Port		Priv Addr		Ext VTag		Ext Port	+ Ext Addr
1234 1234	1 1		10.0.0.1 10.0.0.1		5678 5678		2 2	+ 100.0.0.1 100.1.0.1 +

INIT-ACK[Initiate-Tag = 5678] 10.0.0.1:1 <--- 100.0.0.1:2 Int-VTag = 1234

The handshake finishes with a COOKIE-ECHO acknowledged by a COOKIE-ACK.

Stewart, et al. Expires June 24, 2010 [Page 15]

COOKIE-ECHO 10.0.0.1:1 ---> 100.0.0.1:2 ExtVTag = 5678

COOKIE-ECHO

101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTag = 5678

COOKIE-ACK 101.0.0.1:1 <----- 100.0.0.1:2 Int-VTag = 1234

COOKIE-ACK 10.0.0.1:1 <--- 100.0.0.1:2 Int-VTag = 1234

10.3. Multihomed client and server

The client (Host A) sends an INIT to the server (Host B), but does not include the second address.

+---+ /-----| NAT 1 |-----\ /--\/--\ +----+ \ / \ +----+ ====| Internet |====| Host B | +---+ +---+ / | Host |==== +-----+ / \ / \ A | +---+ \-----| NAT 2 |-----/ \--/\--/ +---+ +---+ NAT 1 | Int | Int | Priv | Ext | Ext | Ext | | VTag | Port | Addr | VTag | Port | Addr +----+ INIT[Initiate-Tag = 1234] 10.0.0.1:1 ----> 100.0.0.1:2 Ext-VTag = 0NAT 1 creates entry:

+----+ NAT 1 | Int | Int | Priv | Ext | Ext | Ext | VTag | Port | Addr | VTag | Port | Addr | +----+ | 1234 | 1 | 10.0.0.1 | 0 | 2 | 100.0.0.1 | +----+

Host B includes its second address in the INIT-ACK, which results in two NAT entries in NAT 1.

+---+ /-----| NAT 1 |-----\ /--\/--\ / +----+ \ / \ / \ +---+ / +---+ | Host |==== ====| Internet |====| Host B | | A | \ +----+ / \ / +----+ +------ NAT 2 |-----/ \--/\--/ +---+

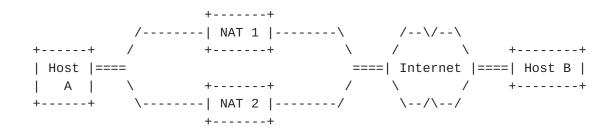

> INIT-ACK[Initiate-Tag = 5678, IP-Addr = 100.1.0.1] 101.0.0.1:1 <----- 100.0.0.1:2 Int-VTag = 1234

NAT 1 updates first entry and creates complete entry for second address:

	+-		+ -		-+-		+		-+-		-++
NAT 1	Ι	Int		Int		Priv	I	Ext	Ι	Ext	Ext
	Ì	VTag	Ì	Port	Ì	Addr		VTag		Port	Addr
	+-		+ -		-+-		+		-+-		-++
	Ι	1234		1	Ι	10.0.0.1		5678	Ι	2	100.0.0.1
	Τ	1234		1		10.0.0.1		5678		2	100.1.0.1
	+-		+ -		-+-	+	+		-+-		-++

INIT-ACK[Initiate-Tag = 5678] 10.0.0.1:1 <----100.0.0.1:2 Int-VTag = 1234

The handshake finishes with a COOKIE-ECHO acknowledged by a COOKIE-ACK.

COOKIE-ECHO 10.0.0.1:1 ----> 100.0.0.1:2 Ext-VTag = 5678

> COOKIE-ECHO 101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTag = 5678

> COOKIE-ACK 101.0.0.1:1 <----- 100.0.0.1:2 Int-VTaq = 1234

COOKIE-ACK 10.0.0.1:1 <----- 100.0.0.1:2 Int-VTag = 1234

Host A announces its second address in an ASCONF. The address parameter contains an undefined address (0) to indicate that the source address should be added. The lookup address pararmeter within the ASCONF chunk will also contain the pair of Vtags (external and internal) so that the NAT may populate its table completely with this single packet.

+---+ /-----| NAT 1 |-----\ /--\/--\ +----+ / +----+ \ / \ / \ +----+ | Host |==== +-----| NAT 2 |-----/ \--/\--/ +---+

ASCONF [ADD-IP=0.0.0.0, INT-VTag=1234, Ext-VTag = 5678] 10.1.0.1:1 ----> 100.1.0.1:2 Ext-VTag = 5678

NAT 2 creates complete entry:

	Int VTag		Int Port		Priv Addr	 	Ext VTag	 	Ext Port	++ Ext Addr
Ì	1234	Ì	1	Ì	10.1.0.1	I	5678	I	2	100.1.0.1

ASCONF [ADD-IP, Int-VTag=1234, Ext-VTag = 5678] 101,1,0,1;1 -----> 100,1,0,1;2 Ext-VTag = 5678

ASCONF-ACK 101.1.0.1:1 <----- 100.1.0.1:2 Int-VTag = 1234

ASCONF-ACK 10.1.0.1:1 <---- 100.1.0.1:2 Int-VTag = 1234

10.4. NAT loses its state

Assocation is already established between Host A and Host B, when the NAT loses its state and obtains a new public address. Host A sends a DATA chunk to Host B.

/--\/--\ +----+ +----+ +----+ / \ | Host A | <-----> | NAT | <----> | Internet | <----> | Host B | +----+ +----+ \ / +---+ \--/\--/

	Int VTag		Int Port		Priv Addr	Ext VTag		Ext Port	+ Ext Addr +	
I	1234	I	1	I	10.0.0.1	5678	Ì	2	100.0.0.1	I

DATA 10.0.0.1:1 ----> 100.0.0.1:2 Ext-VTag = 5678

The NAT box cannot find entry for the association. It sends ERROR message with the M-Bit set and the cause "NAT state missing".

Ext

/--\ +----+ +---+ / \ +---+ | Host A | <----> | NAT | <---> | Internet | <---> | Host B | +---+ \land / +---+ +----+ \--/\--/

ERROR [M-Bit, NAT state missing] 10.0.0.1:1 <----- 100.0.0.1:2 Ext-VTag = 5678

On reception of the ERROR message, HOST A sends an ASCONF indicating that the former information has to be deleted and the source address of the actual packet added.

/--\/--\ / +---+ \ +---+ +---+ | Host A | <-----> | NAT | <----> | Internet | <----> | Host B | +---+ \setminus / +---+ +---+ \--/\--/

ASCONF [ADD-IP, DELETE-IP, Int-VTag=1234, Ext-VTag = 5678] 10.0.0.1:1 ----> 100.1.0.1:2 Ext-VTaq = 5678

Host B adds the new source address and deletes all former entries.

10.5. Peer-to-Peer Communication

If two hosts are behind NATs, they have to get knowledge of the peer's public address. This can be achieved with a so-called rendezvous server. Afterwards the destination addresses are public, and the association is set up with the help of the INIT collision. The NAT boxes create their entries according to their internal peer's point of view. Therefore, NAT A's Internal-VTag and Internal-Port are NAT B's External-VTag and External-Port, respectively. The naming of the verification tag in the packet flow is done from the sending peer's point of view.

Stewart, et al. Expires June 24, 2010 [Page 21]

Internal | External | Internal /--\/---\ +---+ / \ +---+ +----+ +---+ | Host A |<--->| NAT A |<-->| Internet |<-->| NAT B |<--->| Host B | +----+ +----+ \ / +----+ \--/\---/ 1 NAT-Tables +----+ NAT A | Int | Int | Priv | Ext | Ext | Ext | VTag | Port | Addr | VTag | Port | Addr | NAT B | Int | Int | Priv | Ext | Ext | Ext | v-tag | port | addr | v-tag | port | addr INIT[Initiate-Tag = 1234]10.0.0.1:1 --> 100.0.0.1:2 Ext-VTaq = 0NAT A creates entry: NAT A | Int | Int | Priv | Ext | Ext | Ext | VTag | Port | Addr | VTag | Port | Addr | 1234 | 1 | 10.0.0.1 | 0 | 2 | 100.0.0.1 | +----+ INIT[Initiate-Tag = 1234] 101.0.0.1:1 -----> 100.0.0.1:2 Ext-VTag = 0 NAT B processes INIT, but cannot find an entry. The SCTP packet is silently discarded and leaves the NAT table of NAT B unchanged. NAT B | Int | Int | Priv | Ext | Ext | Ext | | VTag | Port | Addr | VTag | Port | Addr |

Now Host B sends INIT, which is processed by NAT B. Its parameters

are used to create an entry. Internal | External External | Internal /--\/---\ / \ +---+ +---+ +----+ | Host A |<--->| NAT A |<-->| Internet |<-->| NAT B |<--->| Host B | +----+ +----+ / +----+ +----+ | \--/\---/ _____ INIT[Initiate-Tag = 5678] 101.0.0.1:1 <-- 10.1.0.1:2 Ext-VTag = 0| Int | Priv | Ext | Ext | NAT B | Int Ext | VTag | Port | Addr | VTag | Port | Addr 5678 2 10.1.0.1 0 1 101.0.0.1 INIT[Initiate-Tag = 5678] 101.0.0.1:1 <----- 100.0.0.1:2 Ext-VTag = 0NAT A processes INIT. As the outgoing INIT of Host A has already created an entry, the entry is found and updated: Internal | External | Internal /--\/---\ / \ +---+ +---+ +---+ +---+

11. IANA Considerations

TBD

12. Security considerations

State maintenance within a NAT is always a subject of possible Denial Of Service attacks. This document recommends that at a minimum a NAT runs a timer on any SCTP state so that old association state can be cleaned up.

13. Acknowledgments

The authors wish to thank Qiaobing Xie, Henning Peters, Bryan Ford, David Hayes, Alfred Hines, Dan Wing, and Jason But for their invaluable comments.
