**Yang Data Model for EVPN**  
**[draft-ietf-bess-evpn-yang-04](#)**

## Abstract

This document describes a YANG data model for Ethernet VPN services. The model is agnostic of the underlay. It applies to MPLS as well as to VxLAN encapsulation. The model is also agnostic of the services including E-LAN, E-LINE and E-TREE services. This document mainly focuses on EVPN and Ethernet-Segment instance framework.

## Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at  
<http://www.ietf.org/1id-abstracts.html>

The list of Internet-Draft Shadow Directories can be accessed at  
<http://www.ietf.org/shadow.html>

## Copyright and License Notice

## [1. Introduction](#)

The Network Configuration Protocol (NETCONF) [[RFC6241](#)] is a network management protocol that defines mechanisms to manage network devices. YANG [[RFC6020](#)] is a modular language that represents data structures in an XML or JSON tree format, and is used as a data modeling language for the NETCONF.

This document introduces a YANG data model for Ethernet VPN services (EVPN) [[RFC7432](#)], Provider Backbone Bridging Combined with Ethernet

Brissette, et. al

Expires August 24, 2018

[Page 2]

VPN (PBB-EVPN) [[RFC7623](#)] as well as other WG draft such as EVPN-VPWS, etc. The EVPN services runs over MPLS and VxLAN underlay.

The Yang data model in this document defines Ethernet VPN based services. The model leverages the definitions used in other IETF Yang draft such as L2VPN Yang.

The goal is to propose a data object model consisting of building blocks that can be assembled in different order to realize different EVPN-based services. The definition work is undertaken initially by a smaller working group with members representing various vendors and service providers. The EVPN basic framework consist of two modules: EVPN and Ethernet-Segment. These models are completely orthogonal. They usually work in pair but user can definitely use one or the other for its own need.

The data model is defined for following constructs that are used for managing the services:

- o Configuration
- o Operational State
- o Notifications

The document is organized to first define the data model for the configuration, operational state and notifications of EVPN and Ethernet-Segment.

The EVPN data object model defined in this document uses the instance centric approach whereby EVPN service attributes are specified for a given EVPN instance.

The Ethernet-Segment data object model defined in this document refer to a specific interface. That interface can be a physical interface, a bundle interface or virtual interface. The latter includes attachment-circuit and pseudowire. The purpose of creating a separate module is due to the fact that it can be used without having the need to have EVPN configured as layer 2/3 service. For example, an access node can be dual-homed to two service nodes servicing a VPLS or an IPVPN core. The access connectivity can be represented by an Ethernet-Segment where EVPN BGP DF election is performed over both service nodes.

## **2. Specification of Requirements**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

Brissette, et. al

[Page 3]

### 3. EVPN YANG Model

#### 3.1. Overview

Two top level module, Ethernet-Segment and EVPN, are defined. The Ethernet-Segment contains a list of interface to which any Ethernet-Segment attributes are configured/applied.

The EVPN module has two main containers: common and instance. The first one has common attributes to all VPNs where as the latter has attributes specific to an EVI (EVPN instance). This document state the scope of the EVPN object models definition. The following documents are within the scope. This is not an exhaustive list but a representation of documents that are covered for this work:

- o Requirements for EVPN: [[RFC7209](#)]
- o EVPN: [[RFC7432](#)]
- o PBB-EVPN: [[RFC7623](#)]
- o EVPN-VPWS: [[RFC8214](#)]

The integration with L2VPN instance Yang model is being done as part of the L2VPN Yang model.

Following documents will be covered at that time:

- o E-TREE Support in EVPN & PBB-EVPN:  
[draft-ietf-bess-evpn-etree](#)
- o (PBB-)EVPN Seamless Integration with (PBB-)VPLS:  
[draft-ietf-bess-evpn-vpls-seamless-integ](#)
- o EVPN Virtual Ethernet Segment:  
[draft-sajassi-bess-evpn-virtual-eth-segment](#)
- o IP Prefix Advertisement in EVPN:  
[draft-ietf-bess-evpn-prefix-advertisement](#)
- o VXLAN DCI Using EVPN:  
[draft-boutros-l2vpn-vxlan-evpn](#)
- o A Network Virtualization Overlay Solution using EVPN:  
[draft-ietf-bess-evpn-overlay](#)
- o Interconnect Solution for EVPN Overlay networks:  
[draft-ietf-bess-dci-evpn-overlay](#)
- o Integrated Routing and Bridging in EVPN:  
[draft-ietf-bess-evpn-inter-subnet-forwarding](#)

#### 3.2 Ethernet-Segment Model

The Ethernet-Segment data model has a list of ES where each refer to an interface. All attributes are optional due to auto-sensing default mode where all values are auto-derive from the network connectivity.

```

### [3.3 EVPN Model](#)

The evpn-instances container contains a list of evpn-instance. Each entry of the evpn-instance represents a different Ethernet VPN and it is represented by a EVI. Again, mainly all attributes are optional

Brissette, et. al

Expires August 24, 2018

[Page 5]

for the same reason as for the Ethernet-Segment module.

```

## [5. Security Considerations](#)

The configuration, state, action and notification data defined in this document are designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [[RFC6242](#)]. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

[Page 25]

The security concerns listed above are, however, no different than faced by other routing protocols. Hence, this draft does not change any underlying security issues inherent in [I-D.ietf-netmod-routing-cfg]

## 6. IANA Considerations

None.
