

L2L3 VPN Multicast MIB
draft-ietf-bess-l2l3-vpn-mcast-mib-00

Abstract

This memo defines an experimental portion of the Management Information Base for use with network management protocols in the Internet community.

In particular, it describes managed objects common to both VPLS and VPN Multicast.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 27, 2015.

1. Introduction

Multicast in VPLS and VPN can be achieved by using provider tunnels to deliver to all or a subset of PEs. The signaling of provider tunnel choice is very similar for both VPLS and VPN multicast (aka MVPN), and this memo describes managed objects common to both VPLS Multicast [[I-D.ietf-l2vpn-vpls-mcast](#)] and MVPN [RFC 6513/6514].

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC 3410](#) [[RFC3410](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, [RFC 2578](#) [[RFC2578](#)], STD 58, [RFC 2579](#) [[RFC2579](#)] and STD 58, [RFC 2580](#) [[RFC2580](#)].

3. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

4. Summary of MIB Module

L2L3-VPN-MCAST-MIB contains a Textual Convention, L2L3VpnMcastProviderTunnelType, and a l2L3VpnMcastPmsiTunnelAttributeTable. Other MIB objects ([[I-D.ietf-l2vpn-vpls-mcast](#)], [[I-D. ietf-l3vpn-mvpn-mib](#)]) may point to entries in the l2L3VpnMcastPmsiTunnelAttributeTable.

For BGP-based signaling (for I-PMSI via auto-discovery
procedure, or for S-PMSI via S-PMSI A-D routes),
they are just as signaled by BGP (RFC 6514 section 5,
'PMSI Tunnel attribute').
For UDP-based S-PMSI signaling for PIM-MVPN,
they're derived from S-PMSI Join Message
(RFC 6513 section 7.4.2, 'UDP-based Protocol').."

Note that BGP-based signaling may be used for
PIM-MVPN as well."

following Tunnel Types:

DESCRIPTION

"For BGP-based I/S-PMSI signaling,
per [RFC 6514 section 5](#), 'PMSI Tunnel Attribute':

If the MPLS Label field is non-zero, then it contains an MPLS label encoded as 3 octets, where the high-order 20 bits contain the label value. Absence of MPLS Label is indicated by setting the MPLS Label field to zero.

For UDP-based S-PMSI signaling for PIM-MVPN, this is not applicable for now, as [RFC 6513](#) does not specify mpls encapsulation and tunnel aggregation with UDP-based signaling."
