BFD Management Information Base (MIB) extensions for MPLS and MPLS-TP Networks draft-ietf-bfd-mpls-mib-01

Abstract

This draft defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it extends the BFD Management Information Base BFD-STD-MIB and describes the managed objects for modeling Bidirectional Forwarding Detection (BFD) protocol for MPLS and MPLS-TP networks.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on December 29, 2012.

1 Introduction

Current MIB for BFD as defined by BFD-STD-MIB is used for neighbor monitoring in IP networks. The BFD session association to the neighbors being monitored is done using the source and destination IP addresses of the neighbors configured using the respective MIB objects.

To monitor MPLS/MPLS-TP paths like tunnels or Pseudowires, there is a necessity to identify or associate the BFD session to those paths.

This memo defines an portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it extends the BFD Management Information Base BFD-STD-MIB and describes the managed objects to configure and/or monitor Bidirectional Forwarding Detection (BFD) protocol for MPLS [BFD-MPLS] and MPLS-TP networks [RFC6428].

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC2578, STD 58, RFC2579 and STD58, RFC2580.

3. Overview

3.1 Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC-2119 [RFC2119].

3.2 Terminology

This document adopts the definitions, acronyms and mechanisms described in [BFD], [BFD-1HOP], [BFD-MH], [BFD-MPLS], [RFC6428]. Unless otherwise stated, the mechanisms described therein will not be re-described here.

4. Acronyms

BFD: Bidirectional Forwarding Detection
IP: Internet Protocol
LSP: Label Switching Path
LSR: Label Switching Router
MIB: Management Information Base
MPLS: Multi-Protocol Label Switching
MPLS-TP: MPLS Transport Profile
ME: Maintenance Entity
MEG: Maintenance Entity Group
MEP: Maintenance Entity End-Point
PW: Pseudowire
TP: Transport Profile

5. Brief description of MIB Objects

The objects described in this section support the functionality described in documents [BFD-MPLS] and [RFC6428]. The objects are defined as an extension to the BFD base MIB defined by BFD-STD-MIB.

5.1. Extensions to the BFD session table (bfdSessionTable)

The BFD session table used to identify a BFD session between a pair of nodes, as defined in BFD-STD-MIB, is extended with managed objects to achieve the required functionality in MPLS and MPLS-TP networks as described below:

1. SessionRole - Active/Passive role specification for the BFD session configured on the node. Either end of a BFD session can be configured as Active/Passive to determine which end starts transmitting the BFD control packets.

2. SessionMode - Defines the mode in which BFD session is running, defined as below:
   i. CC - Only Continuity Check and RDI functionality is performed.

   ii. CV - Provides for Continuity Check, Connectivity Verification and RDI functionalities to be supported.

3. Timer Negotiation Flag - Provides for timer negotiation to be enabled or disabled. This object can be used to tune the detection of period-misconfiguration.

4. Map Type - Indicates the type of the path being monitored by the BFD session.

This object can take the following values:

For BFD session over MPLS based paths:

nonTeIpv4 (1) - BFD session configured for Non-TE
Ipv4 path
nonTeIpv6 (2) - BFD session configured for Non-TE
Ipv6 path
teIpv4 (3) - BFD session configured for a TE
Ipv4 path
teIpv6 (4) - BFD session configured for a TE
Ipv6 path
pw (5) - BFD session configured for a PW

For MPLS-TP based paths:

mep (6) - BFD session configured for an MPLS-TP path
(Bidirectional tunnel, PW or Sections) will map to
the corresponding maintenance entity.

5. Map Pointer

A Row Pointer object which can be used to point to the first accessible object in the respective instance of the table entry identifying the path being monitored (mplsXCEntry/mplsTunnelEntry/ pwEntry respectively for LSP/Tunnel/PW).

For NON-TE LSP, the Map pointer points to the corresponding mplsXCEntry.

For TE based tunnel, the Map pointer points to the corresponding instance of the mplsTunnelEntry.

For PW, this object points to the corresponding instance of pwEntry.

For MPLS-TP paths, this object points to the corresponding instance of mplsOamIdMeEntry configured to monitor the MPLS-TP path associated with the BFD session.

6. Usage of existing object bfdSessType:

Additionally existing object "bfdSessType" in the base MIB can be used with the already defined value multiHopOutOfBandSignaling(3) to specify an OOB (Out of band) mechanism [E.g. LSP Ping] for bootstrapping the BFD session.

5.2. Example of BFD session configuration

This section provides an example of BFD session configuration for an MPLS and MPLS-TP TE tunnel. This example is only meant to enable an understanding of the proposed extension and does not illustrate every permutation of the MIB.

5.2.1 Example of BFD Session configuration for MPLS TE tunnel

This section provides an example BFD session configuration for an MPLS TE tunnel. This example is only meant to enable an understanding of the proposed extension and does not illustrate every permutation of the MIB.

The following denotes the configured tunnel "head" entry:

```
In mplsTunnelTable:
{
 mplsTunnelIndex              = 100,
 mplsTunnelInstance           = 1,
 mplsTunnelIngressLSRId       = 192.0.2.1,
 mplsTunnelEgressLSRId        = 192.0.2.3,
 mplsTunnelName               = "Tunnel",
 ...
 mplsTunnelSignallingProto    = none (1),
 mplsTunnelSetupPrio          = 0,
 mplsTunnelHoldingPrio        = 0,
 mplsTunnelSessionAttributes  = 0,
 mplsTunnelLocalProtectInUse  = false (0),
 mplsTunnelResourcePointer    = mplsTunnelResourceMaxRate.5,
 mplsTunnelInstancePriority   = 1,
 mplsTunnelHopTableIndex      = 1,
 mplsTunnelIncludeAnyAffinity = 0,
 mplsTunnelIncludeAllAffinity = 0,
 mplsTunnelExcludeAnyAffinity = 0,
 mplsTunnelPathInUse          = 1,
 mplsTunnelRole               = head (1),
 ...
 mplsTunnelRowStatus          = Active
 }

 BFD session parameters used to monitor this tunnel should be
 configured on head-end as follows:

 In bfdSessTable:
 BfdSessEntry ::= SEQUENCE {
  -- BFD session index
```

```
        bfdSessIndex                    = 2,
        bfdSessVersionNumber            = 1,
        -- LSP Ping used for OOB bootstrapping
        bfdSessType  = multiHopOutOfBandSignaling,
        ...
        bfdSessAdminStatus              = start,
        ...
        bfdSessDemandModeDesiredFlag  = false,
        bfdSessControlPlaneIndepFlag  = false,
        bfdSessMultipointFlag         = false,
        bfdSessDesiredMinTxInterval   = 100000,
        bfdSessReqMinRxInterval       = 100000,
        ...
        -- Indicates that the BFD session is to monitor
        -- an MPLS TE tunnel
        bfdMplsSessMapType         = teIpv4(3),

        -- OID of the first accessible object (mplsTunnelName) of
        -- the mplsTunnelEntry identifying the MPLS TE tunnel (being
        -- monitored using BFD) in the MPLS  tunnel table.
        -- A value of zeroDotzero indicates that no association
        -- has been made as yet between the BFD session and the path
        -- being monitored.
        -- In the above OID example:
        -- 100 -> Tunnel Index
        -- 1 -> Tunnel instance
        -- 3221225985 -> Ingress LSR Id 192.0.2.1
        -- 3221225987 -> Egress LSR Id 192.0.2.3
        bfdMplsSessMapPointer
                  = mplsTunnelName.100.1.3221225985.3221225987,
        bfdSessRowStatus      = createAndGo
        }
```

Similarly BFD session would be configured on the tail-end of the tunnel. Creating the above row will trigger the bootstrapping of the session using LSP Ping and its subsequent establishment over the path by de-multiplexing of the control packets using the BFD session discriminators.

5.2.2 Example of BFD Session configuration for Maintenance Entity of MPLS-TP TE tunnel

This example considers the OAM identifiers configuration on a head-end LSR to manage and monitor a co-routed bidirectional MPLS tunnel.
Only relevant objects which are applicable for IP based OAM identifiers of co-routed MPLS tunnel are illustrated here.

```
In mplsOamIdMegTable:

{
 -- MEG index (Index to the table)
   mplsOamIdMegIndex                = 1,
   mplsOamIdMegName                 = "MEG1",
   mplsOamIdMegOperatorType         = ipCompatible (1),
   mplsOamIdMegServiceType          = lsp (1),
   mplsOamIdMegMpLocation           = perNode(1),
 -- Mandatory parameters needed to activate the row go here
   mplsOamIdMegRowStatus            = createAndGo (4)
}
```

This will create an entry in the mplsOamIdMegTable to manage and monitor the MPLS tunnel.

The following ME table is used to associate the path information to a MEG.

```
In mplsOamIdMeTable:
{
   -- ME index (Index to the table)
    mplsOamIdMeIndex                 = 1,
   -- MP index (Index to the table)
    mplsOamIdMeMpIndex               = 1,
    mplsOamIdMeName                  = "ME1",
    mplsOamIdMeMpIfIndex             = 0,
    -- Source MEP id is derived from the IP compatible MPLS tunnel
    mplsOamIdMeSourceMepIndex        = 0,
    -- Source MEP id is derived from the IP compatible MPLS tunnel
    mplsOamIdMeSinkMepIndex          = 0,
    mplsOamIdMeMpType                = mep (1),
    mplsOamIdMeMepDirection          = down (2),
    mplsOamIdMeProactiveOamPhbTCValue = 0,
    mplsOamIdMeOnDemandOamPhbTCValue  = 0,
   --  RowPointer MUST point to the first accessible column of an
   --  MPLS tunnel
    mplsOamIdMeServicePointer        = mplsTunnelName.1.1.1.2,
   -- Mandatory parameters needed to activate the row go here
    mplsOamIdMeRowStatus             = createAndGo (4)
}
```

BFD session parameters used to monitor this tunnel should be configured on head-end as follows:

```
In bfdSessTable:
BfdSessEntry ::= SEQUENCE {
  -- BFD session index
```

```
    bfdSessIndex                  = 2,
    bfdSessVersionNumber          = 1,

    -- LSP Ping used for OOB bootstrapping
    bfdSessType  = multiHopOutOfBandSignaling,
    ...
    bfdSessAdminStatus            = start,
    ...
    bfdSessDemandModeDesiredFlag  = false,
    bfdSessControlPlaneIndepFlag  = false,
    bfdSessMultipointFlag         = false,
    bfdSessDesiredMinTxInterval   = 100000,
    bfdSessReqMinRxInterval       = 100000,
    ...
    -- Indicates that the BFD session is to monitor
    -- a ME of an MPLS-TP TE tunnel
    bfdMplsSessMapType         = mep(6),

    bfdMplsSessMapPointer
                = mplsOamIdMeName.1.1.1,
    bfdSessRowStatus      = createAndGo
  }
```

Similarly BFD session would be configured on the tail-end of the tunnel. Creating the above row will trigger the bootstrapping of the session using LSP Ping and its subsequent establishment over the path by de-multiplexing of the control packets using the BFD session discriminators.

5.3. BFD objects for session performance counters

BFD-STD-MIB defines BFD Session Performance Table (bfdSessionPerfTable), for collecting per-session BFD performance counters, as an extension to the bfdSessionTable.

The bfdSessionPerfTable is extended with the performance counters to collect Mis-connectivity Defect, Loss of Continuity Defect and RDI (Remote Defect Indication) counters.

1. bfdMplsSessPerfMisDefCount - Mis-connectivity defect count for this BFD session.
2. bfdMplsSessPerfLocDefCount - Loss of continuity defect count for this BFD session.
3. bfdMplsSessPerfRdiInCount - Total number of RDI messages received for this BFD session.
4. bfdMplsSessPerfRdiOutCount - Total number of RDI messages sent for this BFD session.

5.4. Notification Objects

To be added in the next version of this document.

            contain zeroDotZero or point to an instance identifying
            the mplsOamIdMeEntry configured for monitoring the MPLS-TP
            path associated with this BFD session.

            If this object points to a conceptual row instance
            in a table consistent with bfdMplsSessMapType but this
            instance does not currently exist then no valid
            path is associated with this session entry.

            If this object contains zeroDotZero then no valid path is
            associated with this BFD session entry till it is
            populated with a valid pointer consistent with
            the value of bfdMplsSessMapType as explained above."
