**YANG Data Model for Bidirectional Forwarding Detection (BFD)
draft-ietf-bfd-yang-11.txt**

Abstract

This document defines a YANG data model that can be used to configure and manage Bidirectional Forwarding Detection (BFD).

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 4, 2018.

[1.](#) Introduction

This document defines a YANG data model that can be used to configure and manage Bidirectional Forwarding Detection (BFD) [[RFC5880](#)]. BFD is a network protocol which is used for liveness detection of arbitrary paths between systems. Some examples of different types of paths over which we have BFD:

- 1) Two systems directly connected via IP. This is known as BFD over single-hop IP, a.k.a. BFD for IPv4 and IPv6 [[RFC5881](#)]
- 2) Two systems connected via multiple hops as described in BFD for Multiple Hops. [[RFC5883](#)]
- 3) Two systems connected via MPLS Label Switched Paths (LSPs) as described in BFD for MPLS LSP [[RFC5884](#)]
- 4) Two systems connected via a Link Aggregation Group (LAG) interface as described in BFD on LAG Interfaces [[RFC7130](#)]
- 5) Two systems connected via pseudowires (PWs), this is known as Virtual Circuit Connectivity Verification (VCCV) as described in BFD for PW VCCV [[RFC5885](#)]. This is not addressed in this document.

BFD typically does not operate on its own. Various control protocols, also known as BFD clients, use the services provided by

BFD for their own operation as described in Generic Application of BFD [[RFC5882](#)]. The obvious candidates which use BFD are those which do not have "hellos" to detect failures, e.g. static routes, and routing protocols whose "hellos" do not support sub-second failure detection, e.g. OSPF and IS-IS.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) Network Management Datastore Architecture [[I-D.ietf-netmod-revised-datastores](#)]. This means that the data models do not have separate top-level or sibling containers for configuration and operational state data.

[1.1.](#) Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[2.](#) Design of the Data Model

Since BFD is used for liveness detection of various forwarding paths, there is no uniform key to identify a BFD session. So the BFD data model is split in multiple YANG modules where each module corresponds to one type of forwarding path. For example, BFD for IP single-hop is in one YANG module and BFD for MPLS-TE is in another YANG module. The main difference between these modules is how a BFD session is uniquely identified, i.e the key for the list containing the BFD sessions for that forwarding path. To avoid duplication of BFD definitions, we have common types and groupings which are used by all the modules.

A new control-plane protocol "bfdv1" is defined and a "bfd" container is created under control-plane-protocol as specified in "A YANG Data Model for Routing Management (NMDA Version)" [[I-D.ietf-netmod-rfc8022bis](#)]. This new "bfd" container is augmented by all the YANG modules for their respective specific information:

1. ietf-bfd-ip-sh.yang augments "/routing/control-plane-protocols/control-plane-protocol/bfd/" with the "ip-sh" container for BFD sessions over IP single-hop.
2. ietf-bfd-ip-mh.yang augments "/routing/control-plane-protocols/control-plane-protocol/bfd/" with the "ip-mh" container for BFD sessions over IP multi-hop.

3. `ietf-bfd-lag.yang` augments `"/routing/control-plane-protocols/control-plane-protocol/bfd/"` with the "lag" container for BFD sessions over LAG.
4. `ietf-bfd-mpls.yang` augments `"/routing/control-plane-protocols/control-plane-protocol/bfd/"` with the "mpls" container for BFD over MPLS LSPs.
5. `ietf-bfd-mpls-te.yang` augments `"/routing/control-plane-protocols/control-plane-protocol/bfd/"` with the "mpls-te" container for BFD over MPLS-TE.

BFD can operate in the following contexts:

1. At the network device level
2. In Logical Network Elements as described in YANG Logical Network Element [[I-D.ietf-rtgwg-lne-model](#)]
3. In Network Instances as described in YANG Logical Network Element [[I-D.ietf-rtgwg-ni-model](#)]

When used at the network device level, the BFD YANG model is used "as-is". When the BFD model is to be used in a Logical Network Element or in a Network Instance, the approach taken is to do a schema-mount (see Schema Mount [[I-D.ietf-netmod-schema-mount](#)]) of the BFD model in the appropriate location. For example, if an implementation supports BFD IP multihop in network instances, the implementation would do schema-mount of the BFD IP multihop model in a mount-point which resides in a network instance.

[2.1.](#) Design of Configuration Model

The configuration model consists mainly of the parameters specified in BFD [[RFC5880](#)]. Some examples are desired minimum transmit interval, required minimum receive interval, detection multiplier, etc

BFD clients are applications that use BFD for fast detection of failures. Some implementations have BFD session configuration under the BFD clients. For example, BFD session configuration under routing applications such as OSPF, IS-IS, BGP etc. Other implementations have BFD session configuration centralized under BFD, i.e. outside the multiple BFD clients.

The BFD parameters of interest to a BFD client are mainly the multiplier and interval(s) since those parameters impact the convergence time of the BFD clients when a failure occurs. Other

parameters such as BFD authentication are not specific to the requirements of the BFD client. Ideally all configuration should be centralized under BFD. However, this is a problem for clients of BFD which auto-discover their peers. For example, IGP's do not have the peer address configured, instead the IGP is enabled on an interface and the IGP peers are auto-discovered. So for an operator to configure BFD to an IGP peer, the operator would first have to determine the peer addresses. And when a new peer is discovered, BFD configuration would need to be added. To avoid this issue, we define grouping `client-cfg-parms` in [Section 2.13](#) for BFD clients to configure BFD: this allows BFD clients such as the IGP's to have configuration (multiplier and intervals) for the BFD sessions they need. For example, when a new IGP peer is discovered, the IGP would create a BFD session to the newly discovered peer and similarly when an IGP peer goes away, the IGP would remove the BFD session to that peer. The mechanism how the BFD sessions are created and removed by the BFD clients is outside the scope of this document, but typically this would be done by use of an API implemented by the BFD module on the system. For BFD clients which create BFD sessions via their own configuration, authentication parameters (if required) are still specified in BFD.

2.1.1. Common BFD configuration parameters

The basic BFD configuration parameters are:

`local-multiplier`

This is the detection time multiplier as defined in BFD [\[RFC5880\]](#).

`desired-min-tx-interval`

This is the Desired Min TX Interval as defined in BFD [\[RFC5880\]](#).

`required-min-rx-interval`

This is the Required Min RX Interval as defined in BFD [\[RFC5880\]](#).

Although BFD [\[RFC5880\]](#) allows for different values for transmit and receive intervals, some implementations allow users to specify just one interval which is used for both transmit and receive intervals or separate values for transmit and receive intervals. The BFD YANG model supports this: there is a choice between "min-interval", used for both transmit and receive intervals, and "desired-min-tx-interval" and "required-min-rx-interval". This is supported via a grouping which is used by the YANG modules for the various forwarding paths.

For BFD authentication we have:

key-chain

This is a reference to key-chain defined in YANG Data Model for Key Chains [[RFC8177](#)]. The keys, cryptographic algorithms, key lifetime etc are all defined in the key-chain model.

meticulous

This enables meticulous mode as per BFD [[RFC5880](#)].

2.1.2. Single-hop IP

For single-hop IP, there is an augment of the "bfd" data node in [Section 2](#). The "ip-sh" node contains a list of IP single-hop sessions where each session is uniquely identified by the interface and destination address pair. For the configuration parameters we use what is defined in [Section 2.1.1](#). The "ip-sh" node also contains a list of interfaces, this is used to specify authentication parameters for BFD sessions which are created by BFD clients, see [Section 2.1](#).

[RFC5880] and [[RFC5881](#)] do not specify whether echo function is continuous or on demand. Therefore the mechanism used to start and stop echo function is implementation specific and should be done by augmentation:

- 1) Configuration. This is suitable for continuous echo function. An example is provided in [Appendix A](#).
- 2) RPC. This is suitable for on-demand echo function.

2.1.3. Multihop IP

For multihop IP, there is an augment of the "bfd" data node in [Section 2](#).

Because of multiple paths, there could be multiple multihop IP sessions between a source and a destination address. We identify this as a "session-group". The key for each "session-group" consists of:

source address

Address belonging to the local system as per BFD for Multiple Hops [[RFC5883](#)]

destination address

Address belonging to the remote system as per BFD for Multiple Hops [[RFC5883](#)]

For the configuration parameters we use what is defined in [Section 2.1.1](#)

Here are some extra parameters:

tx-ttl

TTL of outgoing BFD control packets.

rx-ttl

Minimum TTL of incoming BFD control packets.

[2.1.4.](#) MPLS Traffic Engineering Tunnels

For MPLS-TE tunnels, BFD is configured under the MPLS-TE tunnel since the desired failure detection parameters is a property of the MPLS-TE tunnel. This is achieved by augmenting the MPLS-TE data model in YANG Data Model for TE Topologies [[I-D.ietf-teas-yang-te](#)]. For BFD parameters which are specific to the TE application, e.g. whether to tear down the tunnel in the event of a BFD session failure, these parameters will be defined in the YANG model of the MPLS-TE application.

On top of the usual BFD parameters, we have the following per MPLS-TE tunnel:

encap

Encapsulation for the BFD packets: choice between IP, G-ACh and IP with G-ACh as per MPLS Generic Associated Channel [[RFC5586](#)]

For general MPLS-TE data, "mpls-te" data node is added under the "bfd" node in [Section 2](#). Since some MPLS-TE tunnels are uni-directional there is no MPLS-TE configuration for these tunnels on the egress node (note that this does not apply to bi-directional MPLS-TP tunnels). The BFD parameters for the egress node are added under "mpls-te".

[2.1.5.](#) MPLS Label Switched Paths

Here we address MPLS LSPs whose FEC is an IP address. The "bfd" node in [Section 2](#) is augmented with "mpls" which contains a list of sessions uniquely identified by an IP prefix. Because of multiple paths, there could be multiple MPLS sessions to an MPLS FEC. We identify this as a "session-group".

Since these LSPs are uni-directional there is no LSP configuration on the egress node.

The BFD parameters for the egress node are added under "mpls".

2.1.6. Link Aggregation Groups

Per BFD on LAG Interfaces [[RFC7130](#)], configuring BFD on LAG consists of having micro-BFD sessions on each LAG member link. Since the BFD parameters are an attribute of the LAG, they should be under the LAG. However there is no LAG YANG model which we can augment. So a "lag" data node is added to the "bfd" node in [Section 2](#), the configuration is per-LAG: we have a list of LAGs. The destination IP address of the micro-BFD sessions is configured per-LAG and per address-family (IPv4 and IPv6)

2.2. Design of Operational State Model

The operational state model contains both the overall statistics of BFD sessions running on the device and the per session operational information.

The overall statistics of BFD sessions consist of number of BFD sessions, number of BFD sessions up etc. This information is available globally (i.e. for all BFD sessions) under the "bfd" node in [Section 2](#) and also per type of forwarding path.

For each BFD session, mainly three categories of operational state data are shown. The fundamental information of a BFD session such as the local discriminator, remote discriminator and the capability of supporting demand detect mode are shown in the first category. The second category includes a BFD session running information, e.g. the remote BFD state and the diagnostic code received. Another example is the actual transmit interval between the control packets, which may be different from the desired minimum transmit interval configured, is shown in this category. Similar examples are actual received interval between the control packets and the actual transmit interval between the echo packets. The third category contains the detailed statistics of the session, e.g. when the session transitioned up/down and how long it has been in that state.

For some path types, there may be more than 1 session on the virtual path to the destination. For example, with IP multihop and MPLS LSPs, there could be multiple BFD sessions from the source to the same destination to test the various paths (ECMP) to the destination. This is represented by having multiple "sessions" under each "session-group".

2.3. Notifications

This YANG model defines notifications to inform end-users of important events detected during the protocol operation. Pair of local and remote discriminator identifies a BFD session on local system. Notifications also give more important details about BFD sessions; e.g. new state, time in previous state, network-instance and the reason that the BFD session state changed. The notifications are defined for each type of forwarding path but use groupings for common information.

2.4. RPC Operations

None.

2.5. BFD top level hierarchy

At the "bfd" node under control-plane-protocol, there is no configuration data, only operational state data. The operational state data consist of overall BFD session statistics, i.e. for BFD on all types of forwarding paths. The "bfd" node under control-plane-protocol can be used in a network device (top-level), or mounted in an LNE or in a network instance.

```
module: ietf-bfd
augment /rt:routing/rt:control-plane-protocols
  /rt:control-plane-protocol:
    +-rw bfd
      +-ro summary
        +-ro number-of-sessions?          yang:gauge32
        +-ro number-of-sessions-up?       yang:gauge32
        +-ro number-of-sessions-down?     yang:gauge32
        +-ro number-of-sessions-admin-down? yang:gauge32
```

2.6. BFD IP single-hop hierarchy

An "ip-sh" node is added under "bfd" node in control-plane-protocol. The configuration and operational state data for each BFD IP single-hop session is under this "ip-sh" node. The "ip-sh" node can be used in a network device (top-level), or mounted in an LNE or in a network instance.

```
module: ietf-bfd-ip-sh
augment /rt:routing/rt:control-plane-protocols
  /rt:control-plane-protocol/bfd:bfd:

  +--ro interface?       if:interface-ref
  +--ro echo-enabled?    boolean

```

2.7. BFD IP multihop hierarchy

An "ip-mh" node is added under the "bfd" node in control-plane-protocol. The configuration and operational state data for each BFD IP multihop session is under this "ip-mh" node. In the operational state model we support multiple BFD multihop sessions per remote address (ECMP), the local discriminator is used as key. The "ip-mh" node can be used in a network device (top-level), or mounted in an LNE or in a network instance.

```

module: ietf-bfd-ip-mh
augment /rt:routing/rt:control-plane-protocols

2.8. BFD over LAG hierarchy

A "lag" node is added under the "bfd" node in control-plane-protocol. The configuration and operational state data for each BFD LAG session is under this "lag" node. The "lag" node can be used in a network device (top-level), or mounted in an LNE or in a network instance.

```

module: ietf-bfd-lag
augment /rt:routing/rt:control-plane-protocols

2.9. BFD over MPLS LSPs hierarchy

An "mpls" node is added under the "bfd" node in control-plane-protocol. The configuration is per MPLS FEC under this "mpls" node. In the operational state model we support multiple BFD sessions per MPLS FEC (ECMP), the local discriminator is used as key. The "mpls" node can be used in a network device (top-level), or mounted in an LNE or in a network instance.

```

module: ietf-bfd-mpls
augment /rt:routing/rt:control-plane-protocols

```

2.11. Interaction with other YANG modules

Generic YANG Data Model for Connectionless OAM protocols [[I-D.ietf-lime-yang-connectionless-oam](#)] describes how the LIME connectionless OAM model could be extended to support BFD.

Also, the operation of the BFD data model depends on configuration parameters that are defined in other YANG modules.

2.11.1. Module `ietf-interfaces`

The following boolean configuration is defined in A YANG Data Model for Interface Management [[I-D.ietf-netmod-rfc7223bis](#)]:

```
/if:interfaces/if:interface/if:enabled
```

If this configuration is set to "false", no BFD packets can be transmitted or received on that interface.

2.11.2. Module ietf-ip

The following boolean configuration is defined in A YANG Data Model for IP Management [[I-D.ietf-netmod-rfc7277bis](#)]:

```
/if:interfaces/if:interface/ip:ipv4/ip:enabled
    If this configuration is set to "false", no BFD IPv4 packets
    can be transmitted or received on that interface.

/if:interfaces/if:interface/ip:ipv4/ip:forwarding
    If this configuration is set to "false", no BFD IPv4 packets
    can be transmitted or received on that interface.

/if:interfaces/if:interface/ip:ipv6/ip:enabled
    If this configuration is set to "false", no BFD IPv6 packets
    can be transmitted or received on that interface.

/if:interfaces/if:interface/ip:ipv6/ip:forwarding
    If this configuration is set to "false", no BFD IPv6 packets
    can be transmitted or received on that interface.
```

2.11.3. Module ietf-mpls

The following boolean configuration is defined in A YANG Data Model for MPLS Base [[I-D.ietf-mpls-base-yang](#)]:

```
/rt:routing/mpls:mpls/mpls:interface/mpls:config/mpls:enabled
    If this configuration is set to "false", no BFD MPLS packets
    can be transmitted or received on that interface.
```

2.11.4. Module ietf-te

The following configuration is defined in the "ietf-te" YANG module YANG Data Model for TE Topology [[I-D.ietf-teas-yang-te](#)]:

```
/ietf-te:te/ietf-te:tunnels/ietf-te:tunnel/ietf-te:config/ietf-
te:admin-status
    If this configuration is not set to "state-up", no BFD MPLS
    packets can be transmitted or received on that tunnel.
```

2.12. IANA BFD YANG Module

```
<CODE BEGINS> file "iana-bfd-types@2018-03-03.yang"
```

```
module iana-bfd-types {

3. Data Model examples

This section presents some simple and illustrative examples on how to configure BFD.

3.1. IP single-hop

The following is an example configuration for a BFD IP single-hop session. The desired transmit interval and the required receive interval are both set to 10ms.

```
<?xml version="1.0" encoding="UTF-8"?>
<config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces">
    <interface>
      <name>eth0</name>
      <type xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
        ianaift:ethernetCsmacd
      </type>
    </interface>
  </interfaces>
  <routing xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
    <control-plane-protocols>
      <control-plane-protocol>
        <type xmlns:bfd-types="urn:ietf:params:xml:ns:yang:ietf-bfd-types">
          bfd-types:bfdv1
        </type>
        <name>name:BFD</name>
        <bfd xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd">
          <ip-sh xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd-ip-sh">
            <sessions>
              <session>
                <interface>eth0</interface>
                <dest-addr>2001:db8:0:113::101</dest-addr>
                <desired-min-tx-interval>10000</desired-min-tx-interval>
                <required-min-rx-interval>
                  10000
                </required-min-rx-interval>
              </session>
            </sessions>
          </ip-sh>
        </bfd>
      </control-plane-protocol>
    </control-plane-protocols>
  </routing>
</config>
```

3.2. IP multihop

The following is an example configuration for a BFD IP multihop session group. The desired transmit interval and the required receive interval are both set to 150ms.

```
<?xml version="1.0" encoding="UTF-8"?>
<config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <routing xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
    <control-plane-protocols>
      <control-plane-protocol>
        <type xmlns:bfd-types=
          "urn:ietf:params:xml:ns:yang:ietf-bfd-types">
          bfd-types:bfdv1
        </type>
        <name>name:BFD</name>
        <bfd xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd">
          <ip-mh xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd-ip-mh">
            <session-groups>
              <session-group>
                <source-addr>2001:db8:0:113::103</source-addr>
                <dest-addr>2001:db8:0:114::100</dest-addr>
                <desired-min-tx-interval>
                  150000
                </desired-min-tx-interval>
                <required-min-rx-interval>
                  150000
                </required-min-rx-interval>
                <rx-ttl>240</rx-ttl>
              </session-group>
            </session-groups>
          </ip-mh>
        </bfd>
      </control-plane-protocol>
    </control-plane-protocols>
  </routing>
</config>
```

3.3. LAG

The following is an example of BFD configuration for a LAG session. In this case, an interface named "Bundle-Ether1" of interface type "ieee802eadLag" has a desired transmit and required receive interval set to 10ms.

```
<?xml version="1.0" encoding="UTF-8"?>
<config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces">
    <interface>
      <name>Bundle-Ether1</name>
      <type xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
        ianaift:ieee8023adLag
      </type>
    </interface>
  </interfaces>
  <routing xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
    <control-plane-protocols>
      <control-plane-protocol>
        <type xmlns:bfd-types=
          "urn:ietf:params:xml:ns:yang:ietf-bfd-types">
          bfd-types:bfdv1
        </type>
        <name>name:BFD</name>
        <bfd xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd">
          <lag xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd-lag">
            <sessions>
              <session>
                <lag-name>Bundle-Ether1</lag-name>
                <ipv6-dest-addr>2001:db8:112::16</ipv6-dest-addr>
                <desired-min-tx-interval>
                  100000
                </desired-min-tx-interval>
                <required-min-rx-interval>
                  100000
                </required-min-rx-interval>
                <use-ipv6>true</use-ipv6>
              </session>
            </sessions>
          </lag>
        </bfd>
      </control-plane-protocol>
    </control-plane-protocols>
  </routing>
</config>
```

[3.4.](#) MPLS

The following is an example of BFD configured for an MPLS LSP. In this case, the desired transmit and required receive interval set to 250ms.

```
<?xml version="1.0" encoding="UTF-8"?>
<config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <routing xmlns="urn:ietf:params:xml:ns:yang:ietf-routing">
    <control-plane-protocols>
      <control-plane-protocol>
        <type xmlns:bfd-types=
          "urn:ietf:params:xml:ns:yang:ietf-bfd-types">
          bfd-types:bfdv1
        </type>
        <name>name:BFD</name>
        <bfd xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd">
          <mpls xmlns="urn:ietf:params:xml:ns:yang:ietf-bfd-mpls">
            <session-groups>
              <session-group>
                <mpls-fec>2001:db8:114::/116</mpls-fec>
                <desired-min-tx-interval>
                  250000
                </desired-min-tx-interval>
                <required-min-rx-interval>
                  250000
                </required-min-rx-interval>
              </session-group>
            </session-groups>
          </mpls>
        </bfd>
      </control-plane-protocol>
    </control-plane-protocols>
  </routing>
</config>
```

4. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246].

The NETCONF access control model [RFC6536] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the

default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-sh/
sessions: the list specifies the IP single-hop BFD sessions.

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-sh/
sessions: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD IP single-hop session.

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-mh/
session-group: the list specifies the IP multi-hop BFD session groups.

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-mh/
session-group: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD IP multi-hop session.

/routing/control-plane-protocols/control-plane-protocol/bfd/lag/
sessions: the list specifies the BFD sessions over LAG.

/routing/control-plane-protocols/control-plane-protocol/bfd/lag/
sessions: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD over LAG session.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls/
session-group: the list specifies the session groups for BFD over MPLS.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls/
session-group: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD over MPLS LSPs session.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls/
egress: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD over MPLS LSPs sessions for which this device is an MPLS LSP egress node.

/te/tunnels/tunnel: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD session over the MPLS-TE tunnel.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls-te/egress: data nodes local-multiplier, desired-min-tx-interval, required-min-rx-interval, min-interval and authentication all impact the BFD over MPLS-TE sessions for which this device is an MPLS-TE egress node.

The YANG module has writeable data nodes which can be used for creation of BFD sessions and modification of BFD session parameters. The system should "police" creation of BFD sessions to prevent new sessions from causing existing BFD sessions to fail. For BFD session modification, the BFD protocol has mechanisms in place which allow for in service modification.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-sh/summary: access to this information discloses the number of BFD IP single-hop sessions which are up, down and admin-down. The counters include BFD sessions for which the user does not have read-access.

/routing/control-plane-protocols/control-plane-protocol/bfd/ip-mh/summary: access to this information discloses the number of BFD IP multi-hop sessions which are up, down and admin-down. The counters include BFD sessions for which the user does not have read-access.

/routing/control-plane-protocols/control-plane-protocol/bfd/lag/micro-bfd-ipv4-session-statistics/summary: access to this information discloses the number of micro BFD IPv4 LAG sessions which are up, down and admin-down. The counters include BFD sessions for which the user does not have read-access.

/routing/control-plane-protocols/control-plane-protocol/bfd/lag/micro-bfd-ipv6-session-statistics/summary: access to this information discloses the number of micro BFD IPv6 LAG sessions which are up, down and admin-down. The counters include BFD sessions for which the user does not have read-access.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls/summary: access to this information discloses the number of BFD sessions over MPLS LSPs which are up, down and admin-down. The

counters include BFD sessions for which the user does not have read-access.

/routing/control-plane-protocols/control-plane-protocol/bfd/mpls-te/
summary: access to this information discloses the number of BFD
sessions over MPLS-TE which are up, down and admin-down. The
counters include BFD sessions for which the user does not have read-
access.

5. IANA Considerations

The IANA is requested to as assign a new namespace URI from the IETF XML registry.

This document registers the following namespace URIs in the IETF XML registry [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-bfd

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-bfd-ip-sh

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-bfd-mh

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-bfd-lag

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-bfd-mpls

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-bfd-mpls-te

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

5.1. IANA-Maintained iana-bfd-types module

This document defines the initial version of the IANA-maintained iana-bfd-types YANG module.

The iana-bfd-types YANG module is intended to reflect the "BFD Diagnostic Codes" registry and "BFD Authentication Types" registry at <https://www.iana.org/assignments/bfd-parameters/bfd-parameters.xhtml>

6. Acknowledgements

We would also like to thank Nobo Akiya and Jeff Haas for their encouragement on this work. We would also like to thank Rakesh Gandhi and Tarek Saad for their help on the MPLS-TE model. We would also like to thank Acee Lindem for his guidance.

Appendix A. Echo function configuration example

As mentioned in [Section 2.1.2](#), the mechanism to start and stop the echo function, as defined in [\[RFC5880\]](#) and [\[RFC5881\]](#), is implementation specific. In this section we provide an example of how the echo function can be implemented via configuration.

```
module: example-bfd-echo
  augment /rt:routing/rt:control-plane-protocols
    /rt:control-plane-protocol/bfd:bfd
    /bfd-ip-sh:ip-sh/bfd-ip-sh:sessions:
  +-rw echo {bfd-types:echo-mode}?
  +-rw desired-min-echo-tx-interval?  uint32
  +-rw required-min-echo-rx-interval?  uint32
```

A.1. Example YANG module for BFD echo function configuration

```
module example-bfd-echo {
  namespace "tag:example.com,2018:example-bfd-echo";

  prefix "example-bfd-echo";

  import ietf-bfd-types {
    prefix "bfd-types";
  }

  import ietf-bfd {
    prefix "bfd";
  }

  import ietf-bfd-ip-sh {
    prefix "bfd-ip-sh";
  }

  import ietf-routing {
    prefix "rt";
  }

  organization "IETF BFD Working Group";

  contact
    "WG Web:  <http://tools.ietf.org/wg/bfd>
    WG List:  <rtg-bfd@ietf.org>

    Editors:  Reshad Rahman (rrahman@cisco.com),
              Lianshu Zheng (vero.zheng@huawei.com),
              Mahesh Jethanandani (mjethanandani@gmail.com)";
```

  }
}
}
```

[Appendix B.](#) Change log

RFC Editor: Remove this section upon publication as an RFC.

[B.1.](#) Changes between versions -10 and -11

- o Added 2 examples.
- o Added a container around some lists.
- o Fixed some indentation nits.

[B.2.](#) Changes between versions -09 and -10

- o Addressed comments from YANG Doctor review.
- o Addressed comments from WGLC.

[B.3.](#) Changes between versions -08 and -09

- o Mostly cosmetic changes to abide by [draft-ietf-netmod-rfc6087bis](#).
- o Specified yang-version 1.1.
- o Added data model examples.
- o Some minor changes.

B.4. Changes between versions -07 and -08

- o Timer intervals in client-cfg-parms are not mandatory anymore.
- o Added list of interfaces under "ip-sh" node for authentication parameters.
- o Renamed replay-protection to meticulous.

B.5. Changes between versions -06 and -07

- o New ietf-bfd-types module.
- o Grouping for BFD clients to have BFD multiplier and interval values.
- o Change in ietf-bfd-mpls-te since MPLS-TE model changed.
- o Removed bfd- prefix from many names.

B.6. Changes between versions -05 and -06

- o Adhere to NMDA-guidelines.
- o Echo function config moved to appendix as example.
- o Added IANA YANG modules.
- o Addressed various comments.

B.7. Changes between versions -04 and -05

- o "bfd" node in augment of control-plane-protocol.
- o Removed augment of network-instance. Replaced by schema-mount.
- o Added information on interaction with other YANG modules.

B.8. Changes between versions -03 and -04

- o Updated author information.
- o Fixed YANG compile error in ietf-bfd-lag.yang which was due to incorrect when statement.

B.9. Changes between versions -02 and -03

- o Fixed YANG compilation warning due to incorrect revision date in ietf-bfd-ip-sh module.

B.10. Changes between versions -01 and -02

- o Replace routing-instance with network-instance from YANG Network Instances [[I-D.ietf-rtgwg-ni-model](#)]

B.11. Changes between versions -00 and -01

- o Remove BFD configuration parameters from BFD clients, all BFD configuration parameters in BFD
- o YANG module split in multiple YANG modules (one per type of forwarding path)
- o For BFD over MPLS-TE we augment MPLS-TE model
- o For BFD authentication we now use YANG Data Model for Key Chains [[RFC8177](#)]
