**A YANG data model for Traffic Engineering for Bit Index Explicit
Replication (BIER-TE)
draft-ietf-bier-te-yang-02**

Abstract

This document defines a YANG data model for Traffic Engineering for Bit Index Explicit Replication (BIER-TE) configuration and operation.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 13, 2021.

[1.](#) Introduction

[I-D.ietf-bier-te-arch] introduces an architecture for BIER-TE: Traffic Engineering for Bit Index Explicit Replication (BIER). This document defines a YANG data model for BIER TE. The content is in keeping with the TE architecture draft. In addition, this YANG data model contains BIER TE frr items of [[I-D.eckert-bier-te-frr](#)].

[2.](#) Design of the Data Model

The BIER TE YANG model includes BIER TE adjacency configuration and forwarding items configuration. Some features can also be used to enhance BIER TE function, like ECMP and FRR.

```

module: ietf-bier-te

          +--rw index      uint8
          +--rw bitmask?   uint32

```

notifications:

```

+---n bier-te-notification
  +--ro bp-is-zero* [if-index]
    +--ro if-index    if:interface-ref
    +--ro adj-type?    enumeration

```

3. BIER-TE configuration

The BIER-TE forwarding item is indexed by the combination of sub-domain-id, BitStringLength and set identifier.

One interface can be used in different sub-domain, so the BIER TE adjacency information is managed by BIER TE function other than by interface itself.

Because the BIER-TE is controlled by controller now, the information about IGP is not defined. If in the future the IGP is used to carry the information about BIER-TE, the IGP extension will be added in this document.

4. Notifications

If the adjacency id of one adjacency is set to zero, the value is invalid. The notification should be sent to controller and network manager.

5. RPCs

TBD.

6. BIER TE YANG model

7. IANA Considerations

The IANA is requested to assign two new URIs from the IETF XML registry ([[RFC3688](#)]). Authors are suggesting the following URI:

URI: urn:ietf:params:xml:ns:yang:ietf-bier-te

Registrant Contact: BIER WG

XML: N/A, the requested URI is an XML namespace

This document also requests one new YANG module name in the YANG Module Names registry ([[RFC6020](#)]) with the following suggestion:

name: ietf-bier-te

namespace: urn:ietf:params:xml:ns:yang:ietf-bier-te

prefix: bier-te

reference: RFC XXXX

8. Acknowledgement

The authors would like to thank Min Gu (gumin20181129@163.com) for her testing, verification and valuable suggestion. And the authors would like to thank Benjamin R for his valuable comments.

9. Normative References
