**Methodology for Benchmarking Network-layer
Traffic Control Mechanisms**

<[draft-ietf-bmwg-dsmmeth-01.txt](#)>

Intellectual Property Rights (IPR) statement:

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Status of this Memo

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

This document describes the methodology for the benchmarking of devices that implement traffic control based on IP precedence or diff-serv code point criteria. The methodology is to be applied to measurements made on the data plane to evaluate the performance of the traffic control mechanisms. The methodology permits the specific traffic control mechanisms and configuration commands to vary between DUTs. The methodology uses much of the Terminology defined in [[Pp06](#)].

[1. Introduction](#)

This document describes the methodology for the benchmarking of devices that implement traffic control based on IP precedence or diff-serv code point criteria. The methodology is to be applied to measurements made on the data plane to evaluate the performance of the traffic control mechanisms. The methodology permits the specific traffic control mechanisms and configuration commands to vary between DUTs. The methodology uses much of the Terminology defined in [[Pp06](#)].

[2. Existing definitions](#)

For the sake of clarity and continuity this RFC adopts the template for definitions set out in [Section 2 of RFC 1242](#). Definitions are indexed and grouped together in sections for ease of reference. Reference [[Pp06](#)] for benchmarking terminology.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[Br97](#)]. [RFC 2119](#) defines the use of these key words to help make the intent of standards track documents as clear as possible. While this document uses these keywords, this document is not a standards track document.

With Forwarding Congestion

3.2 Test Considerations

3.2.1 Routing Configuration

Routing Protocols SHOULD NOT be used. All routing decisions SHOULD be made based upon pre-configured static routes.

3.2.2 Interface Types

All test cases in this methodology document may be executed with any interface type. All interfaces MUST be the same media and Throughput [5,6] for each test case.

3.2.3 Offered Vector

The Offered Vector MUST be configured on the Tester as follows:

- a. The Offered Load MUST be the Forwarding Capacity of the device at a fixed packet size.
- b. The Forwarding Capacity MUST be measured at the egress interface of the DUT
- c. Each test case MUST be executed using a single, selectable packet size. Packet Size is measured in bytes and includes the IP header and payload. If IPsec packets are used then the packet size also includes it. Packet Size must be equal to or less than the interface MTU so that there is no fragmentation.
- d. It is RECOMMENDED that the number of flows used be 1000, 10000, and/or 100000. A flow MUST be identified by its DSCP, IP Source Address, and IP Destination Address.
- e. It is RECOMMENDED that the number of DSCPs used be 1, 2, 3, 4, 6, 8, 16, and/or 64. When the number of DSCPs is 1 then the Undifferentiated Response is benchmarked. The actual values of the DSCPs used is selectable.

3.2.4 Test Duration

It is RECOMMENDED that the Test Duration for each test case includes a minimum of 10 minutes of Offered Load and Output Vector measurement

3.2.5 Expected Vector

The Expected Vector is configured on the DUT. The Traffic Control mechanisms and specific configuration commands may vary between DUTs. Test Cases may be repeated with variation to the Expected Vector to produce a more benchmark results.

3.3 Reporting Format

For each test case, it is recommended that the following reporting format be completed:

PARAMETERS	UNITS
-----	-----
Offered Vector	

Offered Load	pps
Number of DSCPs	{1..64}
Codepoint Set	{0..63, 0..63, ... , x}
Number of Flows	{1000, 10000, 100000}
Number of Flows per DSCP	Number of Flows/Number of DSCPs
Packet Size	bytes

Undifferentiated Response (Number of DSCPs = 1)

Forwarding Capacity	pps
Packet Loss	packets
Forwarding Delay	
Minimum	msec
Maximum	msec
Average	msec
Jitter	
Average	msec
Peak-to-Peak	msec
Out-of-Order Packets	packets
Duplicate Packets	packets

Expected Vector {for DSCP=n} (as configured on DUT)

Forwarding Capacity	pps
Packet Loss	packets
Forwarding Delay	
Minimum	msec
Maximum	msec
Average	msec

Output Vector {for DSCP=n}

Forwarding Capacity	pps
Packet Loss	packets
Forwarding Delay	
Minimum	msec

	Maximum	msec
	Average	msec
Jitter		
	Average	msec
	Peak-to-Peak	msec
Out-of-Order Packets		packets
Duplicate Packets		packets

4. Test Cases

4.1 Undifferentiated Response

Purpose:

To establish the baseline performance of the DUT.

Procedure:

1. Configure DUT with Expected Vector.
2. Configure the Tester for the Offered Vector.
Number of DSCPs MUST equal 1 and the RECOMMENDED DSCP value is 0 (Best Effort).
Use 1000 Flows identified by IP SA/DA. All flows have the same DSCP value.
3. Using the Test Topology in Figure 1, source the Offered Load from the Tester to the DUT.
4. Measure and record the Output Vector.
5. Maintain offered load for 10 minutes minimum to observe possible variations in measurements.
6. Repeat steps 2 through 5 with 10000 and 100000 Flows.

Expected Results:

Forwarding Vector equals the Offered Load. There is no packet loss and no out-of-order packets.

4.2 Traffic Control Baseline Performance

Purpose:

To benchmark the Output Vectors for a Codepoint Set without Forwarding Congestion.

Procedure:

1. Configure DUT with Expected Vector for each DSCP in the Codepoint Set.
2. Configure the Tester for the Offered Vector.
Number of DSCPs MUST 2 or more. Any DSCP values can be used. Use 1000 Flows identified by IP SA/DA and DSCP value.
3. Using the Test Topology in Figure 1, source the Offered Load from the Tester to the DUT.
4. Measure and record the Output Vector for each DSCP in the Codepoint Set.
5. Maintain offered load for 10 minutes minimum to observe possible variations in measurements.
6. Repeat steps 2 through 5 with 10000 and 100000 Flows.
7. Increment number of DSCPs used and repeat steps

1 through 6.

Expected Results:

Forwarding Vector equals the Offered Load. There is no packet loss and no out-of-order packets. Output vectors match the Expected Vectors for each DSCP in the Codepoint Set.

4.3 Traffic Control Performance with Forwarding Congestion

Purpose:

To benchmark the Output Vectors for a Codepoint Set with Forwarding Congestion.

Procedure:

1. Configure DUT with Expected Vector for each DSCP in the Codepoint Set.
2. Configure the Tester for the Offered Vector.
Number of DSCPs MUST 2 or more. Any DSCP values can be used. Use 1000 Flows identified by IP SA/DA and DSCP value. The Offered Load MUST exceed the Forwarding Capacity of a single egress link by 25% using 2 ingress links.
3. Using the Test Topology in Figure 2, source the Offered Load from the Tester to the DUT. The aggregate of the ingress offered load MUST exceed the Forwarding Capacity of the egress link to produce Forwarding Congestion.
4. Measure and record the Output Vector for each DSCP in the Codepoint Set.
5. Maintain offered load for 10 minutes minimum to observe possible variations in measurements.
6. Repeat steps 2 through 5 with 10000 and 100000 Flows.
7. Increment offered load by 25% to 200% maximum.
8. Increment number of DSCPs used and repeat steps 1 through 6.

Expected Results:

Forwarding Vector equals the Offered Load. There is no packet loss and no out-of-order packets. Output vectors match the Expected Vectors for each DSCP in the Codepoint Set.

5. IANA Considerations

This document requires no IANA considerations.

6. Security Considerations

Documents of this type do not directly affect the security of the Internet or of corporate networks as long as benchmarking is not performed on devices or systems connected to production networks.

Packets with unintended and/or unauthorized DSCP or IP precedence values may present security issues. Determining the security consequences of such packets is out of scope for this document.
