Generalized Labels for Lambda-Switching Capable Label Switching Routers

[draft-ietf-ccamp-gmpls-g-694-lambda-labels-05.txt](#)

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

Abstract

Technology in the optical domain is constantly evolving and as a consequence new equipment providing lambda switching capability has been developed and is currently being deployed. However, [RFC3471] has defined that a wavelength label ([section 3.2.1.1](#)) "only has significance between two neighbors" and global wavelength continuity is not considered. In order to achieve interoperability in a network composed of next generation lambda switch-capable equipment, this document defines a standard lambda label format, being compliant with either [[G.694.1](#)](DWDM-grid) or [[G.694.2](#)](CWDM-grid). Moreover some consideration on how to ensure lambda continuity with RSVP-TE is provided. This document is a companion to the Generalized Multi-Protocol Label Switching (GMPLS) signaling. It defines the label format when Lambda Switching is requested in an all optical network.

[1. Introduction](#)

As described in [[RFC3945](#)], Generalized MPLS (GMPLS) extends MPLS from supporting only packet (Packet Switching Capable - PSC) interfaces and switching to also include support for four new classes of interfaces and switching:

- o Layer-2 Switch Capable (L2SC)
- o Time-Division Multiplex (TDM)
- o Lambda Switch Capable (LSC)
- o Fiber-Switch Capable (FSC).

A functional description of the extensions to MPLS signaling needed to support new classes of interfaces and switching is provided in [\[RFC3471\]](#).

This document presents details that are specific to the use of GMPLS with a new generation of Lambda Switch Capable (LSC) equipment. Technologies such as Reconfigurable Optical Add/Drop Multiplex (ROADM) and Wavelength Cross-Connect (WXC) operate at the wavelength switching level. As such, the wavelength is important information that is necessary to set up a wavelength-based LSP appropriately and the wavelength defined in [\[G.694.1\]](#) or [\[G.694.2\]](#) is widely utilized.

2. Assumed network model and related problem statement

Figure 1 depicts an all-optically switched network consisting of different vendor's optical network domains. Vendor A's network consists of ROADM or WXC, and vendor B's network consists of number of photonic cross-connect (PXC) and Dense wavelength division multiplexing (DWDM) multiplexer & demultiplexer, otherwise both vendors' networks might be based on the same technology.

In this case, the use of standardized wavelength label information is quite significant to establish a wavelength-based LSP. It is also an important constraint when conducting CSPF calculation for RSVP-TE signaling. The way the Constrained Shortest Path First (CSPF) is performed is outside the scope of this document.

It is needless to say, a LSP must be appropriately provisioned between a selected pair of ports not only within Domain A but also over multiple domains satisfying wavelength constraints.

Figure 2 illustrates in detail the interconnection between Domain A and Domain B.

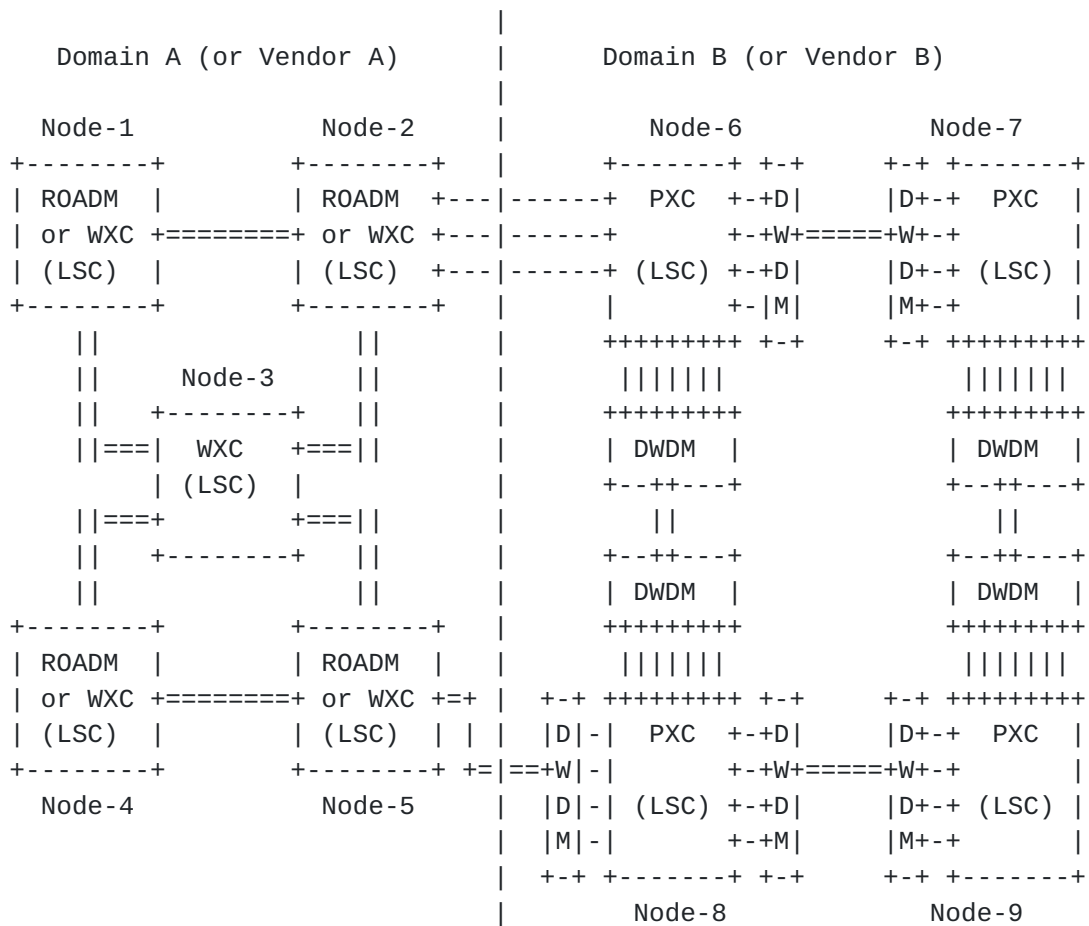

Figure 1 Wavelength-based network model

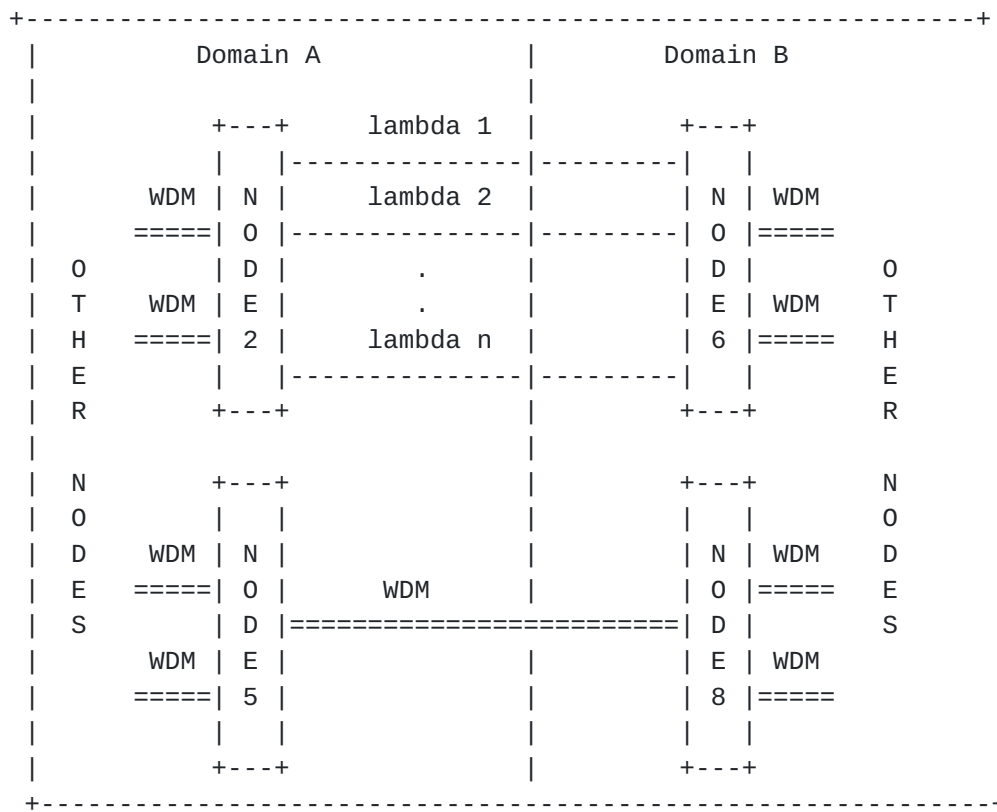

Figure 2 Interconnecting details between two domains

In the scenario of Figure 1, consider the setting up of a bidirectional LSP from ingress switch 1 to egress switch 9. In order to satisfy wavelength continuity constraint, a fixed wavelength (lambda 1) needs to be used in domain A and domain B. A Path message will be used for the signaling, the PATH message must contain the upstream label and a label set object; both containing the same lambda. The label set object is made by only one sub channel that must be same as the upstream label. The path setup will continue downstream to switch 9 by configuring each lambda switch based on the wavelength label. This label allows the correct switching of lambda switches and the label contents needs to be used over the inter-domain. As same above, the path setup will continue downstream to switch 9 by configuring lambda switch based on multiple wavelength labels. If the node has a tunable wavelength transponder, the tuning wavelength is considered as a part of wavelength switching operation.

Not using a standardized label would add undue burden on the operator to enforce policy as each manufacturer may decide on a different representation and therefore each domain may have its own label formats. Moreover, manual provisioning may lead to misconfiguration if domain-specific labels are used.

Therefore, a wavelength label should be standardized in order to allow interoperability between multiple domains; otherwise appropriate existing labels are identified in support of wavelength availability. As identical wavelength information, the ITU-T frequency grid specified in [G.694.1] for Dense WDM (DWDM) and wavelength information in [G.694.2] for Coarse WDM (CWDM) are used by LSRs and should be followed as a wavelength label.

3. Label Related Formats

To deal with the widening scope of MPLS into the optical and time domains, several new forms of "label" have been defined in [RFC3471]. This section contains clarifications for the Wavelength label based on [G.694.1] or [G.694.2] and Label Set definition specific for LSC LSRs.

3.1. Wavelength Labels

In [section 3.2.1.1 of \[RFC3471\]](#), a Wavelength label is defined to have significance between two neighbors, and the receiver may need to convert the received value into a value that has local significance.

LSC equipment uses multiple wavelengths controlled by a single control channel. In such case, the label indicates the wavelength to be used for the LSP. This document proposes to standardize the wavelength label. As an example of wavelength values, the reader is referred to [G.694.1] which lists the frequencies from the ITU-T DWDM frequency grid. The same can be done for CWDM technology by using the wavelength defined in [G.694.2]. In that sense, we can call wavelength labels.

Since the ITU-T DWDM grid is based on nominal central frequencies, we need to indicate the appropriate table, the channel spacing in the grid and a value n that allows the calculation of the frequency. That value can be positive or negative.

The frequency is calculated as such in [G.694.1]:

$$\text{Frequency (THz)} = 193.1 \text{ THz} + n * \text{channel spacing (THz)}$$

, where n is a two's-complement integer (positive, negative or 0) and channel spacing is defined to be 0.0125, 0.025, 0.05 or 0.1 THz. When wider channel spacing such as 0.2 THz is utilized, the combination of narrower channel spacing and the value n can provide proper frequency with that channel spacing. Channel spacing is not utilized to indicate the LSR capability but only to specify a frequency in signaling.

The wavelength is calculated as follows

, where n is a two's-complement integer (positive, negative or 0). The grids listed in [\[G.694.1\]](#) and [\[G.694.2\]](#) are not numbered and change with the changing frequency spacing as technology advances, so an index is not appropriate in this case.

For the case of DWDM, the information carried in a Wavelength label is:

(1) Grid: 3 bits

Grid	Value
Reserved	0
ITU-T DWDM	1
ITU-T CWDM	2
Future use	3 - 7

DWDM channel spacing is defined as follows.

(3) n: 16 bits

3.3. CWDM Wavelength Label

0										1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-
Grid C.S										Reserved										n																					
+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-	+	-

(1) Grid: 3 bits

The value for grid is set to 2 for ITU-T CWDM Grid as defined in [\[G.694.2\]](#).

+-----+-----+		
Grid	Value	
+-----+-----+		
Reserved	0	
+-----+-----+		
ITU-T DWDM	1	
+-----+-----+		
ITU-T CWDM	2	
+-----+-----+		
Future use	3 - 7	
+-----+-----+		

(2) C.S.(channel spacing): 4 bits

CWDM channel spacing is defined as follows.

+-----+-----+		
C.S(nm)	Value	
+-----+-----+		
Reserved	0	
+-----+-----+		
20	1	
+-----+-----+		
Future use	2 - 15	
+-----+-----+		

(3) n: 16 bits

n is a two's-complement integer. The value used to compute the wavelength as shown above.

We do not need to define a new type as the information stored is either a port label or a wavelength label. Only the wavelength label as above needs to be defined.

4. Security Considerations

This document introduces no new security considerations to [\[RFC3473\]](#). GMPLS security is described in [section 11 of \[RFC3471\]](#) and refers to [\[RFC3209\]](#) for RSVP-TE.

5. IANA Considerations

This document has no actions for IANA.

6. Acknowledgments

The authors would like to thank Adrian Farrel, Lawrence Mao, Zafar Ali and Daniele Ceccarelli for the discussion and their comments.

9. Appendix A. DWDM Example

Considering the network displayed in figure 1 it is possible to show an example of LSP set up using the lambda labels.

Node 1 receives the request for establishing an LSP from itself to Node 9. The ITU-T grid to be used is the DWDM one, the channel spacing is 50GHz and the wavelength to be used is 193,35 THz.

Node 1 signals the LSP via a Path message including a Wavelength Label structured as defined in [section 4.2](#):

```

      0              1              2              3
    0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|Grid| C.S. |   Reserved   |              n              |
+-+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

```

Where:

Grid = 1 : ITU-T DWDM grid

C.S. = 2 : 50 GHz channel spacing

n = 5 :

Frequency (THz) = 193.1 THz + n * channel spacing (THz)

193.35 (THz) = 193.1 (THz) + n* 0.05 (THz)

n = (193.35-193.1)/0.05 = 5

10. Appendix B. CWDM Example

The network displayed in figure 1 can be used also to display an example of signaling using the Wavelength Label in a CWDM environment.

This time the signaling of an LSP from Node 4 to Node 7 is considered. Such LSP exploits the CWDM ITU-T grid with a 20nm channel spacing and is to established using wavelength equal to 1331 nm.

Node 4 signals the LSP via a Path message including a Wavelength Label structured as defined in [section 4.3](#):

```

      0              1              2              3
      0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|Grid | C.S  |      Reserved      |              n              |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+

```

Where:

Grid = 2 : ITU-T CWDM grid

C.S. = 1 : 20 nm channel spacing

n = -7 :

Wavelength (nm) = 1471 nm + n * 20 nm

1331 (nm) = 1471 (nm) + n * 20 nm

n = (1331-1471)/20 = -7
