**Generalized Multiprotocol Label Switching (GMPLS)
Label Switching Router (LSR) Management Information Base**

[draft-ietf-ccamp-gmpls-lsr-mib-07.txt](#)

Status of this Memo

By submitting this Internet-Draft, I certify that any applicable patent or other IPR claims of which I am aware have been disclosed, and any of which I become aware will be disclosed, in accordance with [RFC 3668](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects to configure and/or monitor a Generalized Multiprotocol Label Switching (GMPLS) Label Switching Router (LSR).

[1. Introduction](#)

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects for modeling a Generalized Multiprotocol Label Switching (GMPLS) [[RFC3945](#)] Label Switching Router (LSR).

Comments should be made directly to the CCAMP mailing list at ccamp@ops.ietf.org.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#), [RFC 2119](#), reference [[RFC2119](#)].

[1.1. Migration Strategy](#)

There are two MIB modules in this document. The GMPLS LSR MIB module extends the LSR MIB module defined for use with MPLS [[RFC3813](#)]. The only changes made are additions for support of GMPLS or changes that are necessary to support the increased complexity of a GMPLS system. The GMPLS Label MIB module may be referenced using a row pointer from objects within the LSR MIB module.

The companion document modeling and managing GMPLS based traffic engineering [[GMPLSTEMIB](#)] extends the MPLS TE MIB module [[RFC3812](#)] with the same intentions.

Textual conventions and OBJECT-IDENTIFIERS are defined in [[GMPLSTCMIB](#)] which extends the set of textual conventions originally defined in [[RFC3811](#)].

2. Terminology

This document uses terminology from the document describing the MPLS architecture [[RFC3031](#)] and the GMPLS architecture [[RFC3945](#)].

A label switched path (LSP) is modeled as a connection consisting of one or more incoming segments (in-segments) and/or one or more outgoing segments (out-segments) at an LSR. The association or interconnection of the in-segments and out-segments is accomplished by using a cross-connect. We use the terminology "connection" and "LSP" interchangeably where the meaning is clear from the context.

in-segment	This is analogous to a GMPLS label on an interface.
out-segment	This is analogous to a GMPLS label on an interface.
cross-connect	This describes the conceptual connection between a set of in-segments and out-segments. Note that either set may be empty; for example, a cross-connect may connect only out-segments together with no in-segments in the case where an LSP originates on an LSR.

3. The SNMP Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC 3410](#) [[RFC3410](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, [RFC 2578](#) [[RFC2578](#)], STD 58, [RFC 2579](#) [[RFC2579](#)] and STD 58, [RFC 2580](#) [[RFC2580](#)].

4. Outline

Configuring statically provisioned GMPLS LSPs through an LSR involves the following steps:

- Configuring an interface using the MPLS LSR MIB module.

- Enabling GMPLS on GMPLS capable interfaces using this MIB module.
- Configuring in and out-segments using the MPLS LSR MIB module.
- Configuring GMPLS extensions to the in-segments and out-segments using this MIB module.
- Setting up the cross-connect table in the MPLS LSR MIB module to associate segments and/or to indicate connection origination and termination.
- Optionally setting up labels in the label table in this MIB module if the textual convention MplsLabel is not capable of holding the required label (for example, if the label requires more than 32 bits to encode it), or if the operator wishes to disambiguate GMPLS label types.
- Optionally specifying label stack actions in the MPLS LSR MIB module.
- Optionally specifying segment traffic parameters in the MPLS LSR MIB module.

4.1 MIB Modules

There are two MIB modules defined in this document.

The GMPLS LSR MIB module contains tables that extend tables defined in the MPLS LSR MIB module. This MIB module is used in conjunction with the MPLS LSR MIB module in systems that support GMPLS.

The GMPLS Label MIB module contains objects for managing GMPLS labels when they cannot be represented using the textual conventions of the MPLS TC MIB module, or when more detailed access to the sub-fields of the labels is required.

4.1.1 Summary of the GMPLS LSR MIB Module

The MIB tables in this MIB module are as follows.

- The interface configuration table (gmplsInterfaceTable), which extends mplsInterfaceTable to enable the GMPLS protocol on MPLS-capable interfaces.
- The in-segment (gmplsInSegmentTable) and out-segment (gmplsOutSegmentTable) tables extend mplsInSegmentTable and mplsOutSegmentTable to configuring GMPLS-specific parameters for LSP segments at an LSR.

These tables are described in the subsequent sections.

4.1.2 Summary of the GMPLS Label MIB Module

There is one MIB table in this MIB module as follows.

- The `gmplsLabelTable` allows Generalized Labels to be defined and managed in a central location. Generalized Labels can be of variable length and have distinct bit-by-bit interpretations according to the use that is made of them.

These tables are described in the subsequent sections.

5. Bidirectional LSPs

This MIB module supports bidirectional LSPs as required for GMPLS. A single value of `mplsXCIndex` is shared by all of the segments for the entire bidirectional LSP. This facilitates a simple reference from [\[RFC3812\]](#) and [\[GMPLSTEMIB\]](#), and makes fate-sharing more obvious.

It is, however, important that the direction of segments is understood to avoid connecting all in-segments to all out-segments. This is achieved by an object in each segment that indicates the direction of the segment with respect to data flow.

A segment that is marked as 'forward' carries data from the 'head' of the LSP to the 'tail'. A segment marked as 'reverse' carries data in the reverse direction.

Where an LSP is signaled using a conventional signaling protocol, the 'head' of the LSP is the source of the signaling (also known as the ingress) and the 'tail' is the destination (also known as the egress). For manually configured LSPs an arbitrary decision must be made about which segments are 'forward' and which 'reverse'. For consistency this decision should be made across all LSRs that participate in the LSP by assigning 'head' and 'tail' ends to the LSP.

6. Example of LSP Setup

In this section we provide a brief example of using the MIB objects described in sections [7](#) and [8](#) to set up an LSP. While this example is not meant to illustrate every nuance of the MIB, it is intended as an aid to understanding some of the key concepts. It is meant to be read after going through the MIB itself. A prerequisite is an understanding of [\[RFC3813\]](#).

Suppose that one would like to manually create a best-effort, bi-directional LSP. Assume that, in the forward direction, the LSP enters the LSR via MPLS interface A with `ifIndex` 12 and exits the LSR via MPLS interface B with `ifIndex` 13. For the reverse direction, we

assume the LSP enters via interface B and leaves via interface A (i.e. the forward and reverse directions use the same bi-directional interfaces). Let us also assume that we do not wish to have a label stack beneath the top label on the outgoing labeled packets. The following example illustrates which rows and corresponding objects might be created to accomplish this.

We must first create rows in the `gmplsLabelTable` corresponding to the labels required for each of the forward and reverse direction in- and out-segments. For the purpose of this example the forward and reverse labels on each interface will be the same, hence we need to create just two rows in the `gmplsLabelTable` - one for each interface.

In `gmplsLabelTable`:

```
{
  gmplsLabelInterface      = 12,
  gmplsLabelIndex          = 1,
  gmplsLabelSubindex       = 0,
  gmplsLabelType           = gmplsFreeformGeneralizedLabel(3),
  gmplsLabelFreeform       = 0x123456789ABCDEF0
  gmplsLabelRowStatus      = createAndGo(4)
}
```

In `gmplsLabelTable`:

```
{
  gmplsLabelInterface      = 13,
  gmplsLabelIndex          = 1,
  gmplsLabelSubindex       = 0,
  gmplsLabelType           = gmplsFreeformGeneralizedLabel(3),
  gmplsLabelFreeform       = 0xFEDCBA9876543210
  gmplsLabelRowStatus      = createAndGo(4)
}
```

We must next create the appropriate in-segment and out-segment entries. These are done in [\[RFC3813\]](#) using the `mplsInSegmentTable` and `mplsOutSegmentTable`. Note that we use a row pointer to the two rows in the `gmplsLabelTable` rather than specifying the labels explicitly in the in- and out-segment tables. Also note that the row status for each row is set to `createAndWait(5)` to allow corresponding entries in the `gmplsInSegmentTable` and `gmplsOutSegmentTable` to be created.

For the forward direction.

In `mplsInSegmentTable`:

```
{
  mplsInSegmentIndex       = 0x00000015
  mplsInSegmentLabel       = 0, -- incoming label in label table
  mplsInSegmentNPop        = 1,
  mplsInSegmentInterface   = 12, -- incoming interface
}
```

```
-- RowPointer MUST point to the first accesible column.
mplsInSegmentTrafficParamPtr    = 0.0,
mplsInSegmentLabelPtr          = gmplsLabelTable (12, 1, 0)
mplsInSegmentRowStatus          = createAndWait(5)
}

In mplsOutSegmentTable:
{
    mplsOutSegmentIndex          = 0x00000012,
    mplsOutSegmentInterface      = 13, -- outgoing interface
    mplsOutSegmentPushTopLabel   = true(1),
    mplsOutSegmentTopLabel       = 0, -- outgoing label in label table

    -- RowPointer MUST point to the first accesible column.
    mplsOutSegmentTrafficParamPtr = 0.0,
    mplsOutSegmentLabelPtr        = gmplsLabelTable (13, 1, 0)
    mplsOutSegmentRowStatus       = createAndWait(5)
}

For the reverse direction.

In mplsInSegmentTable:
{
    mplsInSegmentIndex          = 0x00000016

    mplsInSegmentLabel          = 0, -- incoming label in label table
    mplsInSegmentNPop           = 1,
    mplsInSegmentInterface      = 13, -- incoming interface

    -- RowPointer MUST point to the first accesible column.
    mplsInSegmentTrafficParamPtr = 0.0,
    mplsInSegmentLabelPtr        = gmplsLabelTable (13, 1, 0)

    mplsInSegmentRowStatus      = createAndWait(5)
}

In mplsOutSegmentTable:
{
    mplsOutSegmentIndex          = 0x00000013,
    mplsOutSegmentInterface      = 12, -- outgoing interface
    mplsOutSegmentPushTopLabel   = true(1),
    mplsOutSegmentTopLabel       = 0, -- outgoing label in label table

    -- RowPointer MUST point to the first accesible column.
    mplsOutSegmentTrafficParamPtr = 0.0,
    mplsOutSegmentLabelPtr        = gmplsLabelTable (12, 1, 0)

    mplsOutSegmentRowStatus      = createAndWait(5)
}
```

These table entries are extended by entries in `gmplsInSegmentTable` and `gmplsOutSegmentTable`. Note that the nature of the 'extends' relationship is that the entry in `gmplsInSegmentTable` has the same index values as the entry in `mplsInSegmentTable`. Similarly, the entry in `gmplsOutSegmentTable` has the same index values as the entry in `mplsOutSegmentTable`.

First for the forward direction:

```
In gmplsInSegmentTable(0x00000015)
{
    gmplsInSegmentDirection      = forward (1)
}
```

```
In gmplsOutSegmentTable(0x00000012)
{
    gmplsOutSegmentDirection     = forward (1)
}
```

Next for the reverse direction:

```
In gmplsInSegmentTable(0x00000016)
{
    gmplsInSegmentDirection      = reverse (2)
}
```

```
In gmplsOutSegmentTable(0x00000013)
{
    gmplsOutSegmentDirection     = reverse (2)
}
```

Next, two cross-connect entries are created in the `mplsXCTable` of the MPLS LSR MIB, thereby associating the newly created segments together.

```
In mplsXCTable:
{
    mplsXCIndex                = 0x01,
    mplsXCInSegmentIndex       = 0x00000015,
    mplsXCOutSegmentIndex      = 0x00000012,
    mplsXCLabelStackIndex      = 0x0102 -- unique ID
    mplsXCRowStatus             = createAndGo(4)
}
```

```
In mplsXCTable:
{
    mplsXCIndex                = 0x02,
    mplsXCInSegmentIndex       = 0x00000016,
    mplsXCOutSegmentIndex      = 0x00000013,
```

```

mplsXCLspId          = 0x0102 -- unique ID
mplsXCLabelStackIndex = 0x00, -- only a single outgoing label
mplsXCRowStatus       = createAndGo(4)
}

```

Finally, the in-segments and out-segments are activated.

```

In mplsInSegmentTable(0x00000015):
{
    mplsInSegmentRowStatus      = active(1)
}
In mplsInSegmentTable(0x00000016):
{
    mplsInSegmentRowStatus      = active(1)
}
In mplsOutSegmentTable(0x00000012):
{
    mplsOutSegmentRowStatus     = active(1)
}
In mplsOutSegmentTable(0x00000013):
{
    mplsOutSegmentRowStatus     = active(1)
}

```

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"A conceptual row in this table is created automatically by an LSR for every interface capable of supporting GMPLS and which is configured to do so. A conceptual row in this table will exist if and only if a corresponding entry in mplsInterfaceTable exists, and a corresponding entry in ifTable exists with ifType = mpls(166). If the associated entry in ifTable is operationally disabled (thus removing the GMPLS capabilities on the interface) or the entry in mplsInterfaceTable is deleted, the corresponding entry in this table MUST be deleted shortly thereafter.

The indexing is the same as that for mplsInterfaceTable. Thus, the entry with index 0 represents the per-platform label space and contains parameters that apply to all interfaces that participate in the per-platform label space."

gmplsLabelIndexNext OBJECT-TYPE
    SYNTAX      IndexIntegerNextFree
    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
        "This object contains an unused value for
        gmplsLabelIndex, or a zero to indicate
        that no unused value exists or is available.

        An management application wishing to create
        a row in the gmplsLabelTable may read this
        object and then attempt to create a row in
        the table. If row creation fails (because
        another application has already created a row
        with the supplied index) the management
        application should read this object again
        to get a new index value.

        When a row is created in the gmplsLabelTable
        with the gmplsLabelIndex value held by this
        object, an implementation MUST change the value
        in this object."
    ::= { gmplsLabelObjects 1 }

gmplsLabelTable OBJECT-TYPE
    SYNTAX      SEQUENCE OF GmplsLabelEntry
    MAX-ACCESS   not-accessible
    STATUS       current
    DESCRIPTION
        "Table of GMPLS Labels. This table allows the representation
        of the more complex label forms required for GMPLS which
        cannot be held within the textual convention MplsLabel. That
        is labels that cannot be encoded within 32 bits. It is,
        nevertheless also capable of holding 32 bit labels or
        regular MPLS labels if desired."
```

Each entry in this table represents an individual GMPLS label value. Labels in the tables in other MIBs are referred to using row pointer into this table. The indexing of this table provides for arbitrary indexing and also for concatenation of labels."

```
::= { gmplsLabelObjects 2 }
```

gmplsLabelEntry OBJECT-TYPE

SYNTAX GmplsLabelEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"An entry in this table represents a single label value. There are three indexes into the table.

- The interface index may be helpful to distinguish which labels are in use on which interfaces or to handle cases where there are a very large number of labels in use in the system. When label representation is desired to apply to the whole system or when it is not important to distinguish labels by their interfaces, this index MAY be set to zero.
- The label index provides a way of identifying the label.
- The label sub-index is only used for concatenated labels. It identifies each component label. When non-concatenated labels are used, this index SHOULD be set to zero.

A storage type object is supplied to control the storage type for each entry, but implementations should note that the storage type of conceptual rows in other tables that include row pointers to an entry in this table SHOULD dictate the storage type of the rows in this table where the row in the other table is more persistent."

gmplsLabelInterface OBJECT-TYPE

SYNTAX InterfaceIndexOrZero

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"The interface on which this label is used. If the label has or could have applicability across the whole system, this object SHOULD be set to zero."

::= { gmplsLabelEntry 1 }

gmplsLabelIndex OBJECT-TYPE

SYNTAX Unsigned32 (0..4294967295)

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"An arbitrary index into the table to identify a label. Note that implementations that are representing 32 bit labels within this table MAY choose to align this index with the value of the label, but should be aware of the implications of sparsely populated tables.

A management application may read the gmplsLabelIndexNext object to find a suitable value for this object."

::= { gmplsLabelEntry 2 }

gmplsLabelSubindex OBJECT-TYPE

SYNTAX Unsigned32 (0..4294967295)

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"In conjunction with gmplsLabelInterface and gmplsLabelIndex, this object uniquely identifies this row. This sub-index allows a single GMPLS label to be defined as a concatenation of labels. This is particularly useful in TDM.

The ordering of sub-labels is strict with the sub-label with lowest gmplsLabelSubindex appearing first. Note that all

sub-labels of a single GMPLS label must share the same

gmplsLabelInterface and gmplsLabelIndex values. For labels that are not composed of concatenated sub-labels, this value SHOULD be set to zero."

::= { gmplsLabelEntry 3 }

gmplsLabelType OBJECT-TYPE

SYNTAX GmplsGeneralizedLabelTypes

MAX-ACCESS read-create

STATUS current

DESCRIPTION

"Identifies the type of this label. Note that this object does not determine whether MPLS or GMPLS signaling is in use: a value of gmplsMplsLabel (1) denotes that a 23 bit MPLS packet label is present, but does not describe whether this is signaled using MPLS or GMPLS.

The value of this object helps determine which of the following objects are valid.

This object cannot be modified if gmplsLabelRowStatus is active(1)."

REFERENCE

9. Security Considerations

It is clear that the MIB modules described in this document in association with the MPLS-LSR-STD-MIB are potentially useful for monitoring of GMPLS LSRs. These MIB modules can also be used for configuration of certain objects, and anything that can be configured can be incorrectly configured, with potentially disastrous results.

There are a number of management objects defined in these MIB modules with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

- o the gmplsInterfaceTable, gmplsInSegmentTable, gmplsOutSegmentTable and gmplsLabelTable collectively contain objects to provision GMPLS interfaces, LSPs and their associated parameters on a Label Switching Router (LSR). Unauthorized write access to objects in these tables, could result in disruption of traffic on the network. This is especially true if an LSP has already been established. The use of stronger mechanisms such as SNMPv3 security should be considered where possible. Specifically, SNMPv3 VACM and USM MUST be used with any SNMPv3 agent which implements these MIB modules.

Some of the readable objects in these MIB modules "i.e., objects with a MAX-ACCESS other than not-accessible" may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly

to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

- o the gmplsInterfaceTable, gmplsInSegmentTable, gmplsOutSegmentTable and gmplsLabelTable collectively show the LSP network topology and its capabilities. If an Administrator does not want to reveal this information, then these tables should be considered sensitive/vulnerable.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure "for example by using IPSec", even then, there is no control as to who on the secure network is allowed to access and GET/SET "read/change/create/delete" the objects in these MIB modules. It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework "see [\[RFC3410\]](#), [section 8](#)", including full support for the SNMPv3 cryptographic mechanisms "for authentication and privacy".

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module, is properly configured to give access to the objects only to those principals "users" that have legitimate rights to indeed GET or SET "change/create/delete" them.

[10. Acknowledgments](#)

This draft is the work of the five authors listed in the Authors' Addresses section.

This document extends [\[RFC3813\]](#). The authors would like to express their gratitude to all those who worked on that earlier MIB document.

The authors would like to express their thanks to Dan Joyle for his careful review and comments on early versions of the Label Table. Special thanks to Joan Cucchiara and Len Nieman for their help with compilation issues.

[11. IANA Considerations](#)

MPLS related standards track MIB modules are rooted under the mplsStdMIB subtree.

One of the MIB modules contained in this document extends tables contained in MPLS MIB modules.

As requested in requested in the GMPLS-TC-STD-MIB [[GMPLSTCMIB](#)] the two MIB modules contained in this document should be placed in the mplsStdMIB subtree as well.

New assignments can only be made via a Standards Action as specified in [[RFC2434](#)].

11.1. IANA Considerations for GMPLS-LSR-STD-MIB

The IANA is requested to assign { mplsStdMIB xx } to the GMPLS-LSR-STD-MIB module specified in this document.

11.2. IANA Considerations for GMPLS-LABEL-STD-MIB

The IANA is requested to assign { mplsStdMIB xx } to the GMPLS-LABEL-STD-MIB module specified in this document.
