A Yang Data Model for WSON Optical Networks

[draft-ietf-ccamp-wson-yang-00.txt](#)

Abstract

This document provides a YANG data model for the routing and wavelength assignment (RWA) TE topology in wavelength switched optical networks (WSONs).

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>

This Internet-Draft will expire on June 21, 2016.

[1. Introduction](#)

This document provides a YANG data model for the routing and wavelength assignment (RWA) Traffic Engineering (TE) topology in wavelength switched optical networks (WSOns). The YANG model described in this document is a WSOn technology-specific Yang model based on the information model developed in [[RFC7446](#)] and the two encoding documents [[RFC7581](#)] and [[RFC7579](#)] that developed protocol independent encodings based on [[RFC7446](#)]. This document augments the generic TE topology draft [[TE-TOP0](#)].

Lee, et al.

Expires September 2016

[Page 2]

What is not in scope of this document is both impairment-aware WSOn and flex-grid.

[2. Routing and Wavelength Assignment Informational Model](#)

The relevant information model in this document comprises

- Connectivity Matrix Model ([Section 2.1](#))
- Resource Pool Model ([Section 2.2](#))
- Port Wavelength Restriction ([Section 2.3](#))
- Wavelength Availability on Links ([Section 2.4](#))

[Editor's Note: This version covers the corresponding YANG data model for the first two sections (Sections [2.1](#) and [2.2](#)) and leaves the YANG model for Sections [2.3](#) and [2.4](#) in the later version.]

Sections [2.1](#) - [2.4](#) rehashes key information models from [RWA-Info] to facilitate the development of the YANG model ([Section 3](#)).

[2.1. Connectivity Matrix Model](#)

The connectivity matrix (ConnectivityMatrix) represents either the potential connectivity matrix for asymmetric switches (e.g. ROADMs and such) or fixed connectivity for an asymmetric device such as a multiplexer.

Note that multiple connectivity matrices are allowed and the Node_ID would be an appropriate identifier for the node to point the Connectivity matrix within the WSOn RWA context.

<Node_Information> ::= <Node_ID> [<ConnectivityMatrix>...]

<ConnectivityMatrix> ::= <MatrixID>

 <ConnType>

 <Matrix>

Where

<MatrixID> is a unique identifier for the matrix.

<ConnType> can be either 0 or 1 depending upon whether the connectivity is either fixed or switched.

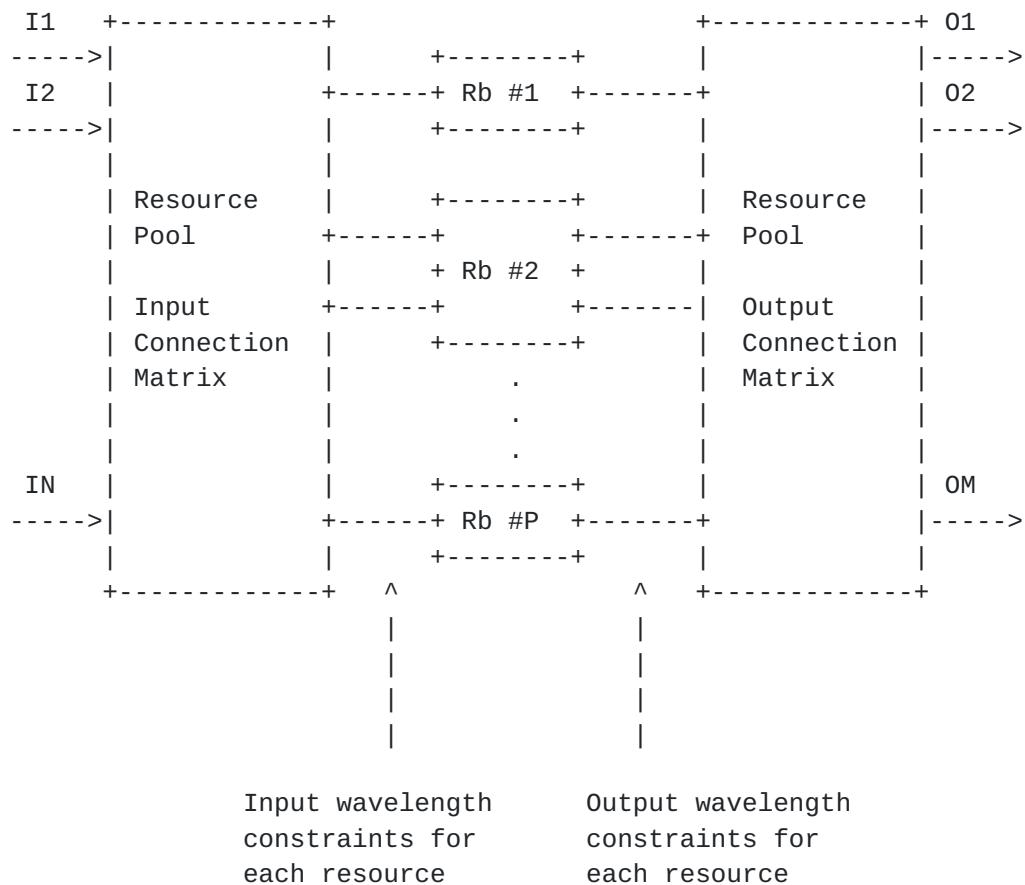

<Matrix> represents the fixed or switched connectivity in that Matrix(i, j) = 0 or 1 depending on whether input port i can connect to output port j for one or more wavelengths.

2.2. Resource Pool Model

A WSON node may include regenerators or wavelength converters arranged in a shared pool. As discussed in [[RFC6163](#)] this can include Optical-Electronic-Optical (OEO) based Wavelength Division Multiplexing (WDM) switches as well. There are a number of different approaches used in the design of WDM switches containing regenerator or converter pools. However, from the point of view of path computation the following need to be known:

1. The nodes that support regeneration or wavelength conversion.
2. The accessibility and availability of a wavelength converter to convert from a given input wavelength on a particular input port to a desired output wavelength on a particular output port.
3. Limitations on the types of signals that can be converted and the conversions that can be performed.

The following Figures show resource pool architecture of WSON.

Note: Rb is a Resource Block.

Figure 1 Schematic diagram of resource pool model.

Since resources tend to be packaged together in blocks of similar devices, e.g., on line cards or other types of modules, the fundamental unit of identifiable resource in this document is the "resource block". A resource block may contain one or more resources. A resource is the smallest identifiable unit of processing allocation. One can group together resources into blocks if they have similar characteristics relevant to the optical system being modeled, e.g., processing properties, accessibility, etc.

This leads to the following formal high level model:

<Node_Information> ::= <Node_ID>

```
[<ConnectivityMatrix>...]
```

```
[<ResourcePool>]
```

Where

```
<ResourcePool> ::= <ResourceBlockInfo>...
```

```
[<ResourceAccessibility>...]
```

```
[<ResourceWaveConstraints>...]
```

```
[<RBPoolState>]
```

```
<ResourceAccessibility> ::= <PoolInputMatrix>
```

```
<PoolOutputMatrix>
```

```
<ResourceWaveConstraints> ::= <InputWaveConstraints>
```

```
<OutputOutputWaveConstraints>
```

```
<RBSharedAccessWaveAvailability> ::= [<InAvailableWavelengths>]
```

```
[<OutAvailableWavelengths>]
```

```
<RBPoolState> ::= <ResourceBlockID>
```

```
<NumResourcesInUse>
```

```
[<RBSharedAccessWaveAvailability>]
```

```
[<RBPoolState>]
```

```
<ResourceBlockInfo> ::= <ResourceBlockSet>
```

```
[<InputConstraints>]  
[<ProcessingCapabilities>]  
[<OutputConstraints>]
```

Where `<ResourceBlockSet>` is a list of resource block identifiers with the same characteristics. If this set is missing the constraints are applied to the entire network element.

```
<InputConstraints> ::= <SharedInput>  
[<OpticalInterfaceClassList>]  
[<ClientSignalList>]  
  
<ProcessingCapabilities> ::= [<NumResources>]  
[<RegenerationCapabilities>]  
[<FaultPerfMon>]  
[<VendorSpecific>]  
  
<OutputConstraints> := <SharedOutput>  
[<OpticalInterfaceClassList>]  
[<ClientSignalList>]  
  
<OpticalInterfaceClassList> ::= <OpticalInterfaceClass> ...  
  
  
<ClientSignalList> ::= [<G-PID>] ...  
1. Number of Resources within the block  
2. Regeneration capability  
3. Fault and performance monitoring  
4. Vendor Specific capability
```

Note that the code points for Fault and performance monitoring and vendor specific capability are subject to further study.

2.3. Port Label Restriction Model

```
<LinkInfo> ::= <LinkID>

    [<AdministrativeGroup>]

    [<InterfaceCapDesc>]

    [<Protection>]

    [<SRLG>...]

    [<TrafficEngineeringMetric>]

    [<PortLabelRestriction>...]
```

Note that these additional link characteristics only applies to line side ports of WDM system or add/drop ports pertaining to Resource Pool (e.g., Regenerator or Wavelength Converter Pool). The advertisement of input/output tributary ports is not intended here.

```
<PortLabelRestriction> ::= <MatrixID>

    <Restriction parameters list>
```

```
<Restriction parameters list> ::=

    <LabelSet> ...
```

Where

MatrixID is the ID of the corresponding connectivity matrix.

LabelSet is a conceptual set of labels (wavelengths).

MaxNumChannels is the maximum number of channels that can be simultaneously used (relative to either a port or a matrix).

LinkSet is a conceptual set of ports.

2.4. Wavelength Availability on Links

In the previously presented information model there are a limited number of information elements that are dynamic, i.e., subject to change with subsequent establishment and teardown of connections. Depending on the protocol used to convey this overall information model it may be possible to send this dynamic information separate from the relatively larger amount of static information needed to characterize WSOn's and their network elements.

```
<DynamicLinkInfo> ::= <LinkID>  
                      <AvailableLabels>  
                      [<SharedBackupLabels>]
```

AvailableLabels is a set of labels (wavelengths) currently available on the link. Given this information and the port wavelength restrictions one can also determine which wavelengths are currently in use. This parameter could potential be used with other technologies that GMPLS currently covers or may cover in the future.

SharedBackupLabels is a set of labels (wavelengths) currently used for shared backup protection on the link. An example usage of this information in a WSOn setting is given in [Shared]. This parameter could potential be used with other technologies that GMPLS currently covers or may cover in the future.

3. YANG Model (Tree Structure)

(Editor's Note: This version is based on the augmentation of [draft-ietf-teas-yang-te-topo \[TE-TOPO\]](#).)
