

**CLUE protocol
draft-ietf-clue-protocol-03**

Abstract

The CLUE protocol is an application protocol conceived for the description and negotiation of a CLUE telepresence session. The design of the CLUE protocol takes into account the requirements and the framework defined, respectively, in [[I-D.ietf-clue-framework](#)] and [[I-D.ietf-clue-telepresence-requirements](#)]. The companion document [[I-D.ietf-clue-signaling](#)] delves into CLUE signaling details, as well as on the SIP/SDP session establishment phase. CLUE messages flow across the CLUE data channel, based on reliable and ordered SCTP over DTLS transport, as described in [[I-D.ietf-clue-datachannel](#)]. Message details, together with the behavior of CLUE Participants acting as Media Providers and/or Media Consumers, are herein discussed.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 9, 2015.

[Page 3]

[1. Introduction](#)

The CLUE protocol is an application protocol used by two CLUE Participants to enhance the experience of a multimedia telepresence session. The main goals of the CLUE protocol are:

1. enabling a MP to properly announce its current telepresence capabilities to a MC in terms of available media captures, groups of encodings, simultaneity constraints and other information envisioned in [[I-D.ietf-clue-framework](#)];
2. enabling a MC to request the desired multimedia streams to the offering MP.

CLUE-capable endpoints are connected by means of the CLUE data channel, an SCTP over DTLS channel which is opened and established as depicted in [[I-D.ietf-clue-signaling](#)] and [[I-D.ietf-clue-datachannel](#)]. CLUE protocol messages flowing across such a channel are detailed in this document, both syntactically and semantically.

In [Section 3](#) we provide a general overview of the CLUE protocol. CLUE protocol messages are detailed in [Section 4](#). The CLUE Participant state machine is introduced in [Section 5](#). Versioning and extensions are discussed in [Section 7](#) and [Section 8](#), respectively. The XML schema defining the CLUE messages is reported in [Section 10](#).

[2. Terminology](#)

This document refers to the same terminology used in [[I-D.ietf-clue-framework](#)] and in [[I-D.ietf-clue-telepresence-requirements](#)]. We briefly recall herein some of the main terms used in the document. The definition of "CLUE Participant" herein proposed is not imported from any of the above documents.

CLUE Participant: An entity able to use the CLUE protocol within a telepresence session. It can be either an endpoint or an MCU able to use the CLUE protocol.

Endpoint: The logical point of final termination through receiving, decoding and rendering, and/or initiation through capturing, encoding, and sending of media streams. An endpoint consists of one or more physical devices which source and sink media streams, and exactly one [[RFC4353](#)] Participant (which, in turn, includes exactly one SIP User Agent). Endpoints can be anything from multiscreen/multicamera room controllers to handheld devices.

Presta & Romano

Expires August 9, 2015

[Page 4]

MCU: Multipoint Control Unit (MCU) - a device that connects two or more endpoints together into one single multimedia conference [[RFC5117](#)]. An MCU may include a Mixer [[RFC4353](#)].

Media: Any data that, after suitable encoding, can be conveyed over RTP, including audio, video or timed text.

Media Capture: A "Media Capture", or simply "Capture", is a source of Media.

Capture Encoding: A specific encoding of a Media Capture, to be sent via RTP [[RFC3550](#)].

Media Stream: The term "Media Stream", or simply "Stream", is used as a synonymous of Capture Encoding.

Media Provider: A CLUE Participant (i.e., an Endpoint or an MCU) able to send Media Streams.

Media Consumer: A CLUE Participant (i.e., an Endpoint or an MCU) able to receive Media Streams.

[3. Overview of the CLUE protocol](#)

The CLUE protocol is conceived to enable CLUE telepresence sessions. It is designed in order to address SDP limitations in terms of the description of some information about the multimedia streams that are involved in a real-time multimedia conference. Indeed, by simply using SDP we are not able to convey information about the features of the flowing multimedia streams that are needed to enable a "being there" rendering experience. Such information is designed in the CLUE framework document and formally defined and described in the CLUE data model document. The CLUE protocol represents the mechanism for the exchange of CLUE information between CLUE Participants. It mainly provides the messages to enable a Media Provider to advertise its telepresence capabilities and to enable a Media Consumer to select the desired telepresence options.

The CLUE protocol, as defined in the following, is a stateful, client-server, XML-based application protocol. CLUE protocol messages flow on a reliable and ordered SCTP over DTLS transport channel connecting two CLUE Participants. Messages carry information taken from the XML-based CLUE data model ([\[I-D.ietf-clue-data-model-schema\]](#)). Three main communication layers can be identified:

1. Establishment of the CLUE data channel: in this phase, the CLUE data channel setup takes place. If it completes successfully,

Presta & Romano

Expires August 9, 2015

[Page 5]

the CPs are able to communicate and start the initiation phase.

2. Negotiation of the CLUE protocol version and options (initiation phase): the CPs connected via the CLUE data channel agree on the version and on the options to be used during the telepresence session. Special CLUE messages are used for such a task. At the end of this basic negotiation, each CP starts its activity as a CLUE MP and/or CLUE MC.
3. CLUE telepresence capabilities description and negotiation: in this phase, the MP-MC dialogues take place on the data channel by means of the CLUE protocol messages.

As soon as the channel is ready, the CLUE Participants must agree on the protocol version and extensions to be used within the telepresence session. CLUE protocol version numbers are characterized by a major version number and a minor version number, both unsigned integers, separated by a dot. While minor version numbers denote backward compatible changes in the context of a given major version, different major version numbers generally indicate a lack of interoperability between the protocol implementations. In order to correctly establish a CLUE dialogue, the involved CPs MUST have in common a major version number (see [Section 7](#) for further details). The subset of the protocol options and extensions that are allowed within the CLUE session is also determined in the initiation phase, such subset being the one including only the options that are supported by both parties. A mechanism for the negotiation of the CLUE protocol version and extensions is envisioned in the initiation phase. According to such a solution, the CP which is the CLUE Channel initiator (CI) issues a proper CLUE message (OPTIONS) to the CP which is the Channel Receiver (CR) specifying the supported version and extensions. The CR then answers by selecting the subset of the CI extensions that it is able to support and determines the protocol version to be used.

After that negotiation phase is completed, CLUE Participants describe and agree on the media flows to be exchanged. Indeed, being CPs A and B both transmitting and receiving, it is possible to distinguish between two dialogues:

1. the one needed to describe and set up the media streams sent from A to B, i.e., the dialogue between A's Media Provider side and B's Media Consumer side
2. the one needed to describe and set up the media streams sent from B to A, i.e., the dialogue between B's Media Provider side and A's Media Consumer side

Presta & Romano

Expires August 9, 2015

[Page 6]

CLUE messages for the media session description and negotiation are designed by considering the MP side as the server side of the protocol, since it produces and provides media streams, and the MC side as the client side of the protocol, since it requests and receives media streams. The messages that are exchanged to set up the telepresence media session are described by focusing on a single MP-MC dialogue.

The MP first advertises its available media captures and encoding capabilities to the MC, as well as its simultaneity constraints, according to the information model defined in [[I-D.ietf-clue-framework](#)]. The CLUE message conveying the MP's multimedia offer is the ADVERTISEMENT message. Such message leverages the XML data model definitions provided in [[I-D.ietf-clue-data-model-schema](#)].

The MC selects the desired MP streams by using the CONFIGURE message, which makes reference to the information carried in the previously received ADVERTISEMENT.

Besides ADVERTISEMENT and CONFIGURE, other messages have been conceived in order to provide all the needed mechanisms and operations. Such messages will be detailed in the following sections.

4. Protocol messages

CLUE protocol messages are textual, XML-based messages that enable the configuration of the telepresence session. The formal definition of such messages is provided in the XML Schema at the end of this document ([Section 10](#)).

The XML definitions of the CLUE information provided in [[I-D.ietf-clue-data-model-schema](#)] are included within some CLUE protocol messages (namely the ADVERTISEMENT and the CONFIGURE messages), in order to use the concepts defined in [[I-D.ietf-clue-framework](#)].

The CLUE protocol messages are the following:

- o OPTIONS
- o OPTIONS RESPONSE
- o ADVERTISEMENT (ADV)
- o ADVERTISEMENT ACKNOWLEDGEMENT (ACK)

Presta & Romano

Expires August 9, 2015

[Page 7]

- o CONFIGURE (CONF)
- o CONFIGURE RESPONSE (CONF RESPONSE)

While the OPTIONS and OPTIONS RESPONSE messages are exchanged in the initiation phase between the CPs, the other messages are involved in MP-MC dialogues.

Each CLUE message inherits a basic structure depicted in the following excerpt:

```
<!-- CLUE MESSAGE TYPE -->
<xss:complexType name="clueMessageType" abstract="true">
<xss:sequence>
<xss:element name="clueId" type="xss:string"/>
<xss:element name="sequenceNr" type="xss:unsignedInt"/>
</xss:sequence>
<xss:attribute name="protocol" type="xss:string" fixed="CLUE" use="required"/>
<xss:attribute name="v" type="versionType" use="required"/>
</xss:complexType>

<!-- VERSION TYPE -->
<xss:simpleType name="versionType">
<xss:restriction base="xss:string">
<xss:pattern value="([0-9])+\.([0-9]+)"></xss:pattern>
</xss:restriction>
</xss:simpleType>
```

The basic structure determines the mandatory information that is carried within each CLUE message. This information is composed of:

- o clueId: an XML element containing the identifier of the CP within the telepresence system;
- o sequenceNr: an XML element containing the local message sequence number;
- o protocol: a mandatory attribute set to "CLUE", identifying the protocol the messages refer to;
- o v: a mandatory attribute carrying the version of the protocol. The content of the "v" attribute is composed of the major version number followed by a dot and then by the minor version number of the CLUE protocol in use. Allowed values are of this kind: "1.3", "2.45", etc.

Presta & Romano

Expires August 9, 2015

[Page 8]

Each CP should manage up to three streams of sequence numbers: (i) one for the messages exchanged in the initiation phase, (ii) one for the messages exchanged as MP, and (iii) one for the messages exchanged as MC.

4.1. OPTIONS

The OPTIONS message is sent from the CP which is the CI to the CP which is the CR as soon as the CLUE data channel is ready. Besides the information envisioned in the basic structure, it specifies:

- o mediaProvider: a mandatory boolean field set to "true" if the CP is able to act as a MP
- o mediaConsumer: a mandatory boolean field set to "true" if the CP is able to act as a MC
- o supportedVersions: the list of the supported versions
- o supportedOptions: the list of the supported options

The XML Schema of such a message is reported below:

[Page 10]

<supportedVersions> contains the list of the versions that are supported by the CI, each represented in a child <version> element. The content of each <version> element is a string made by the major version number followed by a dot and then by the minor version number (e.g., 1.3 or 2.43). Only one <version> element SHOULD be provided for each major version supported, containing the maximum minor version number of such a version, since all minor versions are backward compatible. If no <supportedVersions> is carried within the OPTIONS message, the CI supports only the version declared in the "v" attribute and all the versions having the same major version number and lower minor version number. For example, if the "v" attribute has a value of "3.4" and there is no <supportedVersions> tag in the OPTIONS message, it means the CI supports only major version 3 with all the minor versions comprised between 3.0 and 3.4, with version 3.4 included. If a <supportedVersion> is provided, at least one <version> tag MUST be included.

The <supportedOptions> element specifies the list of options supported by the CI. If there is no <supportedOptions> in the OPTIONS message, the CI does not support anything other than what is envisioned in the versions it supports. For each option, an <option> element is provided. An option is characterized by a name, an XML schema of reference where the option is defined, and the version of the protocol which the option refers to.

4.2. OPTIONS RESPONSE

The OPTIONS RESPONSE is sent by a CR to a CI as a reply to the OPTIONS message. As depicted in the figure below, the OPTIONS RESPONSE contains mandatorily a response code and a response string indicating the processing result of the OPTIONS message. Following, the CR attaches two boolean tags, <mediaProvider> and <mediaConsumer>, expressing the supported roles in terms of respectively MP and MC, similarly to what the CI does in the OPTIONS message. These two elements are optional in the OPTIONS RESPONSE since, in case of error response code, the CR might not want to add further information besides the response code and the reason string. In case of no errors, the CR MUST insert within the OPTIONS RESPONSE the <mediaProvider> and the <mediaConsumer> elements. Finally, the highest commonly supported version number is expressed in the <version> field. The content of the <version> element MUST be a string made of the major version number followed by a dot and then by the minor version number (e.g., 1.3 or 2.43). Matching options (i.e., those in common between the CI and the CR) are copied in the the <commonOptions> field.

Presta & Romano

Expires August 9, 2015

[Page 11]

```
<!-- CLUE OPTIONS RESPONSE -->
<xss:complexType name="optionsResponseMessageType">
<xss:complexContent>
<xss:extension base="clueMessageType">
<xss:sequence>
<xss:element name="responseCode" type="xs:short"/>
<xss:element name="reasonString" type="xs:string"/>
<xss:element name="mediaProvider" type="xs:boolean" minOccurs="0"/>
<xss:element name="mediaConsumer" type="xs:boolean" minOccurs="0"/>
<xss:element name="version" type="versionType" minOccurs="0"/>
<xss:element name="commonOptions" type="optionsListType" minOccurs="0"/>
<xss:any namespace="##other"
processContents="lax" minOccurs="0"/>
</xss:sequence>
<xss:anyAttribute namespace="##other" processContents="lax"/>
</xss:extension>
</xss:complexContent>
</xss:complexType>
```

After the reception of such a message, the version to be used is determined by each part of the conversation. Indeed, it is the one provided in the <version> tag of the OPTIONS RESPONSE message. The following CLUE messages MUST use such a version number in the "v" attribute. The allowed options in the CLUE dialogue will be those indicated in the <commonOptions> of the OPTIONS RESPONSE message.

4.3. ADVERTISEMENT

The ADVERTISEMENT message (ADV) is used by the MP to advertise the available media captures and related information to the MC. The MP sends to the MC an ADV as soon as it is ready after the successful completion of the initiation phase, i.e., as soon as the version and the options of the CLUE protocol are agreed between the CPs. During the telepresence session, the ADV can be sent from the MP both periodically and on a per-event basis, i.e., each time there are changes in the MP's CLUE telepresence capabilities.

The ADV structure is defined in the picture below. The ADV contains elements compliant with the CLUE data model that characterize the MP's telepresence offer. Namely, such elements are: the list of the media captures (<mediaCaptures>), of the encoding groups (<encodingGroups>), of the capture scenes (<captureScenes>) of the global views (<globalViews>), and of the represented participants (<people>). Each of them is fully described in the CLUE framework document and formally defined in the CLUE data model document.

Presta & Romano

Expires August 9, 2015

[Page 12]

```

<!-- CLUE ADVERTISEMENT MESSAGE TYPE -->
<xs:complexType name="advertisementMessageType">
<xs:complexContent>
<xs:extension base="clueMessageType">
<xs:sequence>
<!-- mandatory -->
<xs:element name="mediaCaptures" type="dm:mediaCapturesType"/>
<xs:element name="encodingGroups" type="dm:encodingGroupsType"/>
<xs:element name="captureScenes" type="dm:captureScenesType"/>
<!-- optional -->
<xs:element name="simultaneousSets" type="dm:simultaneousSetsType"
  minOccurs="0"/>
<xs:element name="globalViews" type="dm:globalViewsType"
  minOccurs="0"/>
<xs:element name="people" type="dm:peopleType" minOccurs="0"/>
<xs:any namespace="##other" processContents="lax" minOccurs="0"/>
</xs:sequence>
<xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:extension>
</xs:complexContent>
</xs:complexType>

```

[4.4. ADVERTISEMENT ACKNOWLEDGEMENT](#)

The ADVERTISEMENT ACKNOWLEDGEMENT message (ACK) is sent by a MC to a MP to acknowledge an ADV message. As it can be seen from the message schema provided in the following, the ACK contains a response code and a reason string describing the processing result of the ADV. The <advSequenceNr> carries the sequence number of the ADV the ACK refers to.

```

<!-- ADV ACK MESSAGE TYPE -->
<xs:complexType name="advAcknowledgementMessageType">
<xs:complexContent>
<xs:extension base="clueMessageType">
<xs:sequence>
<xs:element name="responseCode" type="xs:short"/>
<xs:element name="reasonString" type="xs:string"/>
<xs:element name="advSequenceNr" type="xs:unsignedInt"/>
<xs:any namespace="##other" processContents="lax" minOccurs="0"/>
</xs:sequence>
<xs:anyAttribute namespace="##other" processContents="lax"/>
</xs:extension>
</xs:complexContent>
</xs:complexType>

```

Presta & Romano

Expires August 9, 2015

[Page 13]

4.5. CONFIGURE

The CONFIGURE message (CONF) is sent from a MC to a MP to list the advertised captures the MC wants to receive. The MC can send a CONF after the reception of an ADV or each time it wants to request other captures that have been previously advertised by the MP. The content of the CONF message is shown below.

```
<!-- CLUE CONFIGURE MESSAGE TYPE -->
<xs:complexType name="configureMessageType">
<xs:complexContent>
<xs:extension base="clueMessageType">
<xs:sequence>
<!-- mandatory fields -->
<xs:element name="advSequenceNr" type="xs:unsignedInt"/>
<xs:element name="ack" type="xs:boolean" minOccurs="0" fixed="true"/>
<xs:element name="captureEncodings" type="dm:captureEncodingsType"
minOccurs="0"/>
<xs:any namespace="#other" processContents="lax" minOccurs="0"/>
</xs:sequence>
<xs:anyAttribute namespace="#other" processContents="lax"/>
</xs:extension>
</xs:complexContent>
</xs:complexType>
```

The <advSequenceNr> element contains the sequence number of the ADV message the CONF refers to.

The optional boolean <ack> element, set to "true", if present, indicates that the CONF message also acknowledges receipt of the referred advertisement, hence providing a piggybacking mechanism for the simultaneous acknowledgment and response to the ADV message. The <ack> element SHOULD not be present if an ACK message has been already sent back to the MP.

The most important content of the CONFIGURE message is the list of the capture encodings provided in the <captureEncodings> element. Such an element contains a sequence of capture encodings, representing the streams to be instantiated.

4.6. CONFIGURE RESPONSE

Presta & Romano

Expires August 9, 2015

[Page 14]

```

<!-- CONFIGURE RESPONSE MESSAGE TYPE -->
<xss:complexType name="configureResponseMessageType">
<xss:complexContent>
<xss:extension base="clueMessageType">
<xss:sequence>
<xss:element name="responseCode" type="xs:short"/>
<xss:element name="reasonString" type="xs:string"/>
<xss:element name="confSequenceNr" type="xs:unsignedInt"/>
<xss:any namespace="##other" processContents="lax" minOccurs="0"/>
</xss:sequence>
<xss:anyAttribute namespace="##other" processContents="lax"/>
</xss:extension>
</xss:complexContent>
</xss:complexType>
```

The CONFIGURE RESPONSE message (CONF RESPONSE) is sent from the MP to the MC to communicate the processing result of requests carried in the previously received CONF message. It contains a response code with a reason string indicating either the success or the failure (along with failure details) of a CONF request processing.

Following, the <confSequenceNr> field contains the number of the CONF message the response refers to.

4.7. Response codes and reason strings

Examples of response codes and strings are provided in the following table.

Response code	Response string	Description
200	Success	The request has been successfully processed.
310	Bad syntax	The XML syntax of the message is not correct.

Presta & Romano

Expires August 9, 2015

[Page 15]

311	Invalid value	The message contains an invalid parameter value.
312	Version not supported	The protocol version used in the message is not supported.
313	Invalid sequencing	The sequence number of the message is out of date.
412	Invalid identifier	The identifier used in the message is not valid or unknown.
413	Conflicting values	The message contains values that cannot be used together.
420	ADV Expired	The number of the ADV the CONF refers to is out of date.
510	Version not supported	The protocol version used in the message is not supported.

5. Protocol state machines

The CLUE protocol is an application protocol used between two CPs in order to properly configure a multimedia telepresence session. CLUE protocol messages flow across the CLUE Data Channel, a DTLS/SCTP channel established as depicted in [[I-D.ietf-clue-signaling](#)]. Over such a channel there are typically two CLUE streams between the channel terminations flowing in opposite directions. In other words, typically, both channel terminations act simultaneously as a MP and

Presta & Romano

Expires August 9, 2015

[Page 16]

as a MC. We herein discuss the state machines associated, respectively, with the CLUE Participant, with the MC process and with the MP process.

6. CLUE Participant's state machine

The main state machines focus on the behavior of the CLUE Participant (CP) acting as a CLUE channel initiator/receiver (CI/CR).

The initial state is called IDLE. When in the IDLE state, the CLUE data channel is not established and no CLUE-controlled media are exchanged between the two considered telepresence devices (if there is an ongoing exchange of media streams, such media streams are not currently CLUE-controlled).

When the CLUE data channel set up starts ("start channel setup"), the CP moves from the IDLE state to the CHANNEL SETUP state.

If the CLUE data channel is successfully set up ("channel established"), the CP moves from the CHANNEL SETUP state to the OPTIONS state. Otherwise ("channel error"), it moves back to the IDLE state. The same transition happens if the telepresence session ends ("session ends").

When in the OPTIONS state, the CP addresses the initiation phase where both parts agree on the version and on the options to be used in the subsequent CLUE messages exchange phase. If the CP is the Channel Initiator (CI), it sends an OPTIONS message and waits for the OPTIONS RESPONSE message. If the CP is the Channel Receiver (CR), it waits for the OPTIONS message and, as soon as it arrives, replies with the OPTIONS RESPONSE message. If the negotiation is successfully completed ("OPTIONS phase success"), the CP moves from the OPTIONS state to the ACTIVE state. If the initiation phase fails ("OPTIONS phase failure"), the CP moves from the OPTIONS state to the IDLE state. The initiation phase might fail because of one of the following reasons:

1. the CI receives an OPTIONS RESPONSE with an error response code
2. the CI does not receive any OPTIONS RESPONSE and a timeout error is raised
3. the CR does not receive any OPTIONS and a timeout error is raised

When in the ACTIVE state, the CP starts the envisioned sub-state machines (i.e., the MP state machine and the MC state machine) according to the roles it plays in the telepresence sessions. Such roles have been previously declared in the OPTIONS and OPTIONS

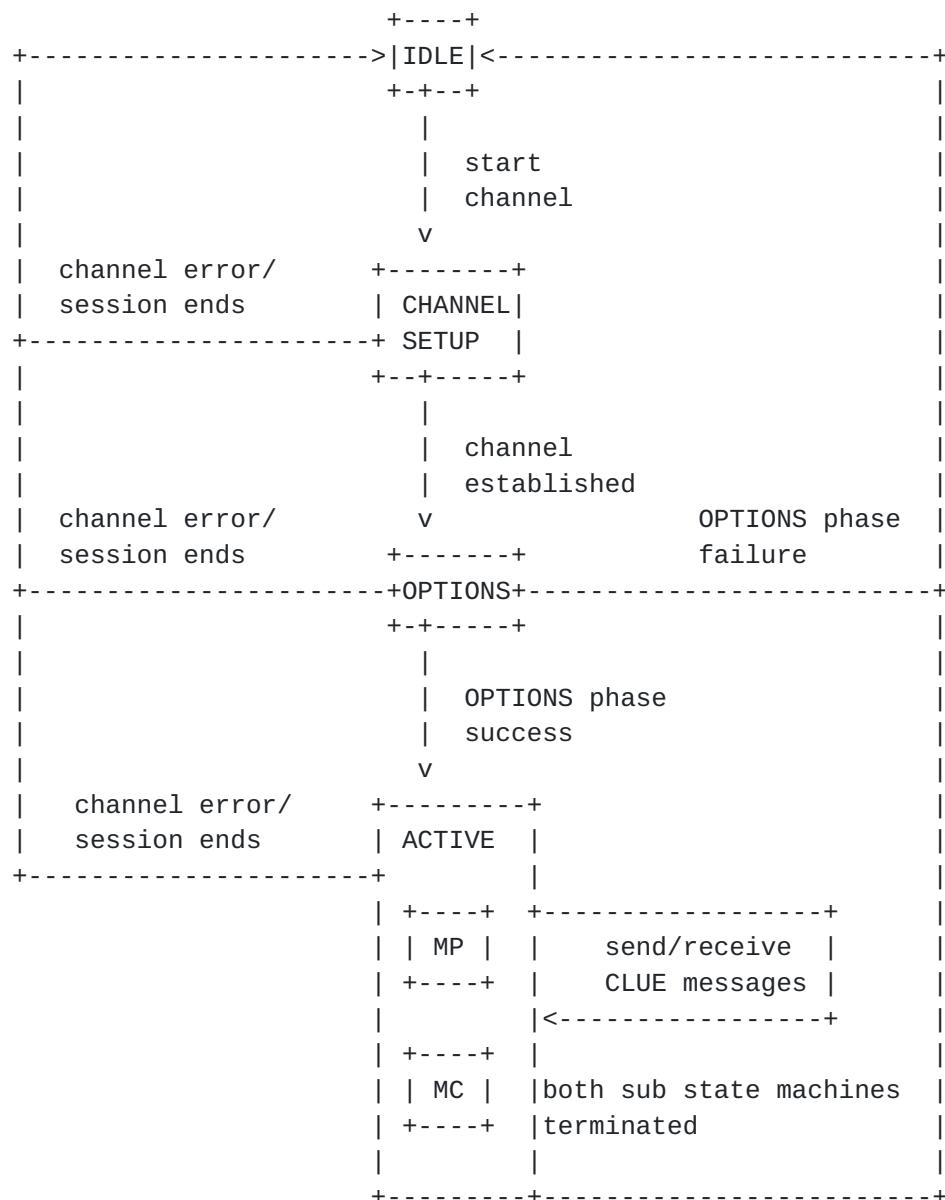

Presta & Romano

Expires August 9, 2015

[Page 17]

RESPONSE messages involved in the initiation phase (see OPTIONS sections [Section 4.1](#) and [Section 4.2](#) for the details). When in the ACTIVE state, the CP delegates the sending and the processing of the CLUE messages to the appropriate MP/MC sub-state machines. If the CP receives a further OPTIONS/OPTIONS RESPONSE message, it MUST ignore the message and stay in the ACTIVE state.

The CP moves from the ACTIVE state to the IDLE one when the sub-state machines that have been activated are (both) in the relative TERMINATED state (see sections [Section 6.1](#) and [Section 6.2](#)).

Presta & Romano

Expires August 9, 2015

[Page 18]

6.1. Media Provider's state machine

As soon as the sub-state machine of the MP is activated, it is in the ADV state. In the ADV state, the MP is preparing the ADV message reflecting its actual telepresence capabilities.

After the ADV has been sent, the MP moves from the ADV state to the WAIT FOR ACK state. If an ACK message with a successful response code arrives ("ACK received"), the MP moves to the WAIT FOR CONF state. If an ACK with an error response code arrives ("NACK received") and the number of NACKs for the issued ADV is under the retry threshold, the MP moves back to the ADV state for preparing a new ADV. The same happens if the waiting time for the ACK is fired a number of times under the retry threshold ("timeout && retry not expired"): also in this case, the MP goes back to the ADV state to send a new copy of the ADV. If the number of retries overcomes the threshold, the MP moves from the WAIT FOR ACK state to the MP-TERMINATED state. When in the WAIT FOR ACK state, if a CONF+ACK message arrives ("CONF+ACK received"), the MP goes directly to the CONF RESPONSE state. CONF+ACK messages referring to out-of-date ADVs MUST be ignored, i.e., they do not trigger any state transition. If the telepresence settings of the MP change while in the WAIT FOR ACK state ("changed telepresence settings"), the MP MUST create a new advertisement, so it switches from the WAIT FOR ACK state to the ADV state.

When in the WAIT FOR CONF state, the MP is listening to the channel for a CONF request coming from the MC. If a CONF arrives ("CONF received"), the MP switches to the CONF RESPONSE state. In case of a timeout, if the retry threshold has not been overcome ("timeout && retry not expired"), the MP moves back to the ADV state. When the retry expires ("retry expired") the MP moves to the MP TERMINATED state. If the telepresence settings change in the meanwhile ("changed telepresence settings"), the MP moves from the WAIT FOR CONF back to the ADV state to create the new ADV to be sent to the MC.

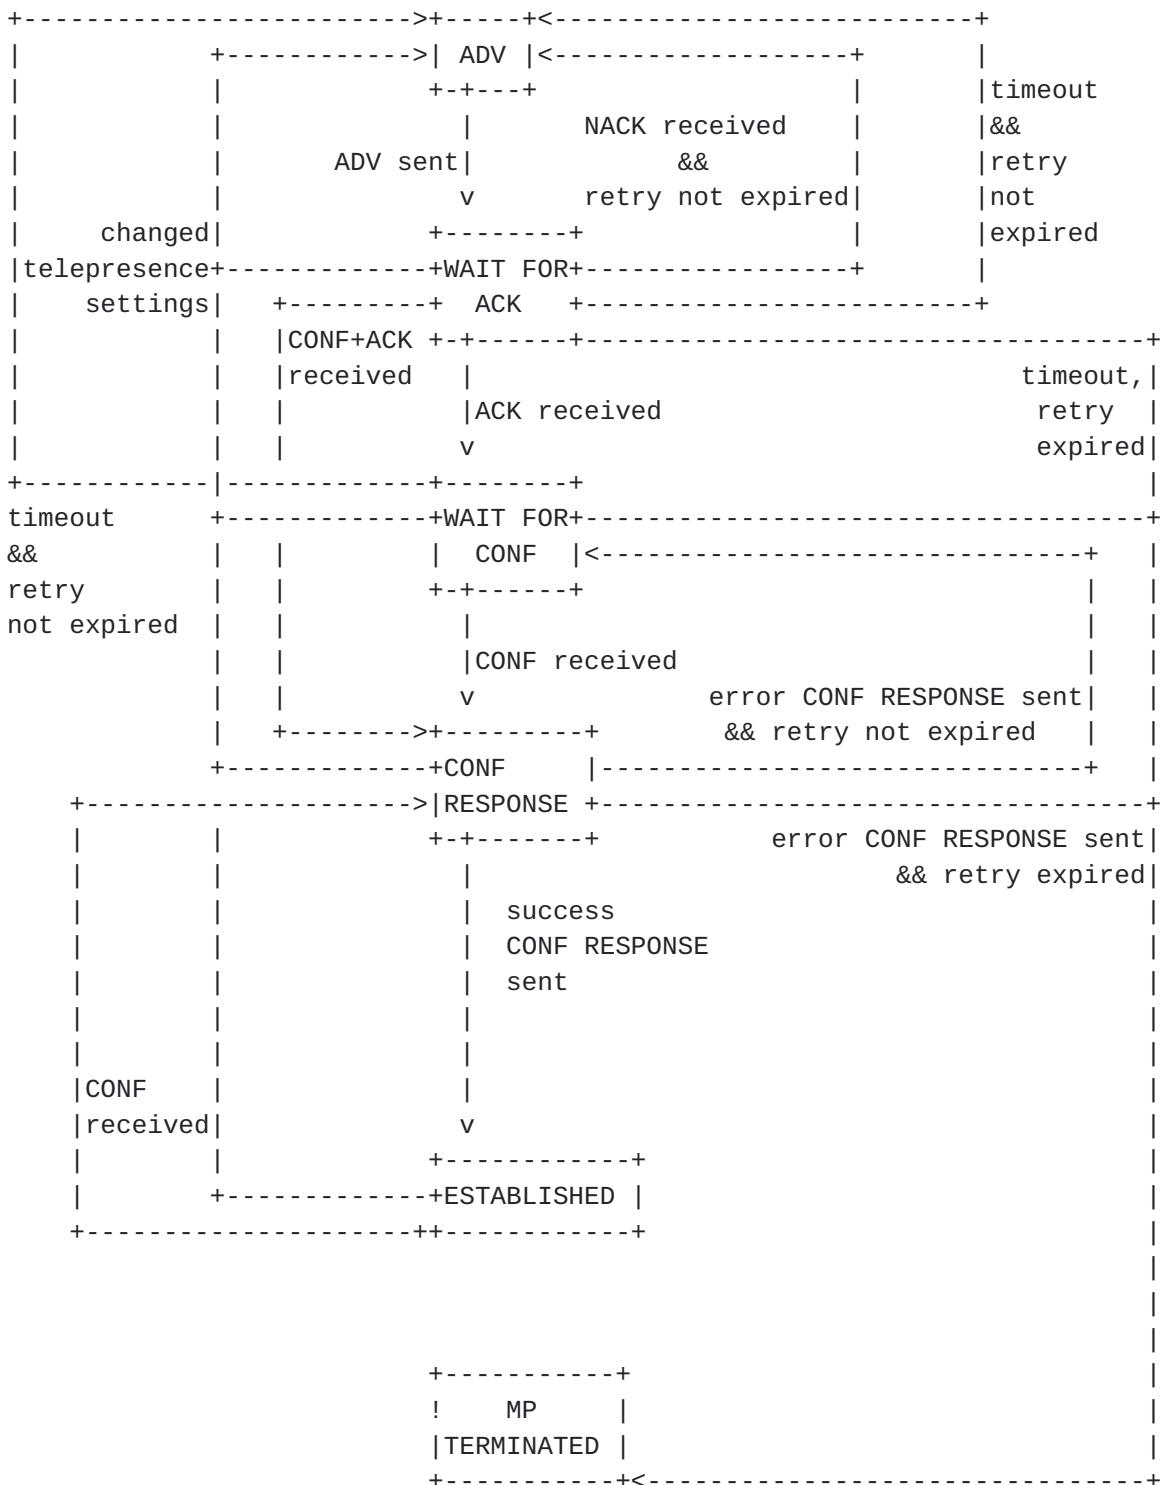

The MP in the CONF RESPONSE state is processing the received CONF in order to produce a CONF RESPONSE message. If the MP is fine with the MC's configuration, then it sends a 200 OK CONF RESPONSE ("success CONF RESPONSE sent") and moves to the ESTABLISHED state. If there are errors in the CONF processing, then the MP issues a CONF RESPONSE carrying an error response code ("error CONF RESPONSE sent") and, if under the retry threshold ("retry not expired"), it goes back to the WAIT FOR CONF state to wait for a new configuration request. If the number of trials exceeds the retry threshold ("retry expired"), the state MP TERMINATED is reached. Finally, if there are changes in the MP's telepresence settings, the MP switches to the ADV state.

Presta & Romano

Expires August 9, 2015

[Page 19]

The MP in the ESTABLISHED state has successfully negotiated the media streams with the MC by means of the CLUE messages. If there are changes in the MP's telepresence settings, the MP moves back to the ADV state. In the ESTABLISHED state, the CLUE-controlled media streams of the session are those described in the last successfully processed CONF message.

Presta & Romano

Expires August 9, 2015

[Page 21]

6.2. Media Consumer's state machine

As soon as the sub-state machine of the MC is activated, it is in the WAIT FOR ADV state. An MC in the WAIT FOR ADV state is waiting for an ADV coming from the MP. If the ADV arrives ("ADV received"), the MC reaches the ADV PROCESSING state. Otherwise, the MC is stuck in the WAIT FOR ADV state.

In the ADV PROCESSING state, the ADV is parsed by the MC. If the ADV is successfully processed, there are two possibilities. According to the former option, the MC issues a successful ACK message to the MP ("ACK sent") and moves to the CONF state. In the latter case, the MC sends a CONF message with the <ack> field set to "true" ("CONF+ACK sent") and goes directly to the WAIT FOR CONF RESPONSE state.

If something goes wrong with the ADV parsing (bad syntax, missing XML elements, etc.), and the number of times this has happened is under the retry threshold, the MC sends a NACK message (an ACK with an error response code) to the MP describing the problem via a proper reason phrase. In this way ("NACK sent && retry not expired"), the MC switches back to the WAIT FOR ADV state, waiting for a new ADV. If the NACK retry expires ("retry expired"), the MC moves to the MC TERMINATED state.

When in the CONF state, the MC is preparing the CONF request to be issued to the MP on the basis of the previously ACK-ed ADV. When the CONF has been sent ("CONF sent"), the MC moves to the WAIT FOR CONF RESPONSE state. If a new ADV arrives in the meanwhile, the MC goes back to the PROCESSING ADV state.

In the WAIT FOR CONF RESPONSE state, the MC is waiting for the MP's response to the issued CONF or CONF+ACK. If a 200 OK CONF RESPONSE message is received ("successful CONF RESPONSE received"), it means that the MP and the MC have successfully agreed on the media streams to be shared. Then, the MC can move to the ESTABLISHED state. On the other hand, if an error response is received and the associated retry counter does not overcome the threshold ("error CONF RESPONSE received && retry not expired"), the MC moves back to the CONF state to prepare a new CONF request. In case of "retry expired", the MC moves to the MC TERMINATED state. If no CONF RESPONSE arrives at all, and the number of timeouts is under the threshold, the MC moves to the WAIT FOR ADV state, waiting for a new ADV. If a new ADV is received in the WAIT FOR CONF RESPONSE state, the MC switches to the ADV PROCESSING state.

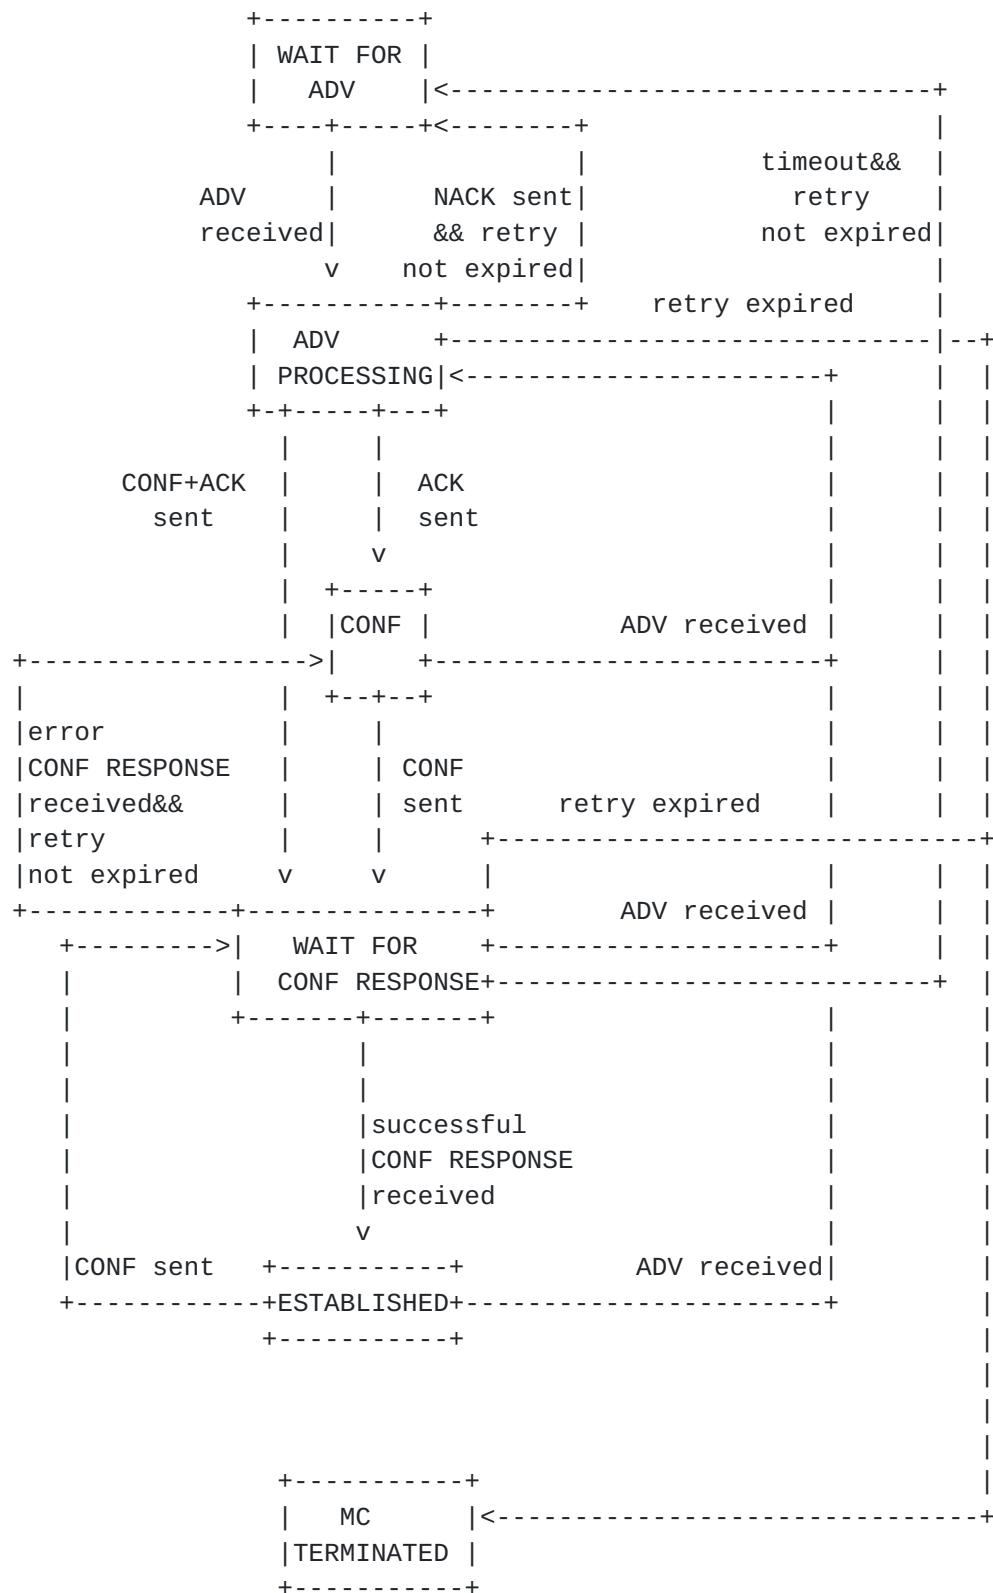

When the MC is in the ESTABLISHED state, the telepresence session configuration has been set up at the CLUE application level according to the MC's preferences. Both the MP and the MC have agreed on (and

Presta & Romano

Expires August 9, 2015

[Page 22]

are aware of) the CLUE-controlled media streams to be exchanged within the call. While in the ESTABLISHED state, it might happen that the MC decides to change something in the call settings. The MC then issues a new CONF ("CONF sent") and goes to wait for the new CONF RESPONSE in the WAIT FOR CONF RESPONSE state. If a new ADV arrives from the MP ("ADV received"), it means that something has changed on the MP's side. The MC then moves to the ADV PROCESSING state.

[Page 24]

[7.](#) Versioning

CLUE protocol messages are XML messages compliant to the CLUE protocol XML schema. The version of the protocol corresponds to the version of the schema. Both client and server have to test the compliance of the received messages with the XML schema of the CLUE protocol. If the compliance is not verified, the message cannot be processed further.

Obviously, client and server cannot communicate if they do not share exactly the same XML schema. Such a schema is the one included in this document, and associated with the CLUE URN "urn:ietf:params:xml:ns:clue-message". If all CLUE-enabled devices use that schema there will be no interoperability problems due to schema issues.

The version of the XML schema contained in the standard document deriving from this draft will be 1.0. The version usage is similar in philosophy to XMPP ([[RFC6120](#)]). A version number has major and minor components, each a non-negative integer. Major version changes denote non-interoperable changes. Minor version changes denote schema changes that are backward compatible by ignoring unknown XML elements, or other backward compatible changes.

The minor versions of the XML schema MUST be backward compatible, not only in terms of schema but also semantically and procedurally. This means that they should define further features and functionality besides those defined in the previous versions, in an incremental way, without impacting the basic rules defined in the previous version of the schema. In this way, if a MP is able to speak, e.g., version 1.5 of the protocol while the MC only understands version 1.4, the MP should have no problem in reverting the dialogue back to version 1.4 without exploiting 1.5 features and functionality.

It is expected that, before the CLUE protocol XML schema reaches a steady state, prototypes developed by different organizations will conduct interoperability testing. In that case, in order to interoperate, they have to be compliant to the current version of the XML schema, i.e., the one copied in the most up-to-date version of the draft defining the CLUE protocol. The versions of the non-standard XML schema will be numbered as 0.01, 0.02, and so on. During the standard development phase, the versions of the XML schema will probably not be backward compatible so it is left to prototype implementers the responsibility of keeping their products up to date.

[Page 25]

8. Extensions and options

Although the standard version of the CLUE protocol XML schema will be designed to thoroughly cope with the requirements emerging from the application domain, new needs might arise and extensions can be designed. Extensions specify information and behaviors that are not described in a certain version of the protocol. They can relate to:

1. new information, to be carried in the existing messages. For example, we may want to add more fields within an existing message;
2. new messages. This is the case if there is no proper message for a certain task, so a brand new CLUE message needs to be defined.

As to the first type of extensions, it is possible to distinguish between protocol-specific and data model information. Indeed, CLUE messages are envelopes carrying both:

- o (i) XML elements defined within the CLUE protocol XML schema itself (protocol-specific information)
- o (ii) other XML elements compliant to the CLUE data model schema (data model information)

When new protocol-specific information is needed somewhere in the protocol messages, it can be added in place of the <any> elements and <anyAttribute> elements envisioned by the protocol schema. The policy currently defined in the protocol schema for handling <any> and <anyAttribute> elements is:

- o elementFormDefault="qualified"
- o attributeFormDefault="unqualified"

In that case, the new information must be qualified by namespaces other than "urn:ietf:params:xml:ns:clue-message" (the protocol URN) and "urn:ietf:params:xml:ns:clue-info" (the data model URN). Elements or attributes from unknown namespaces MUST be ignored.

The other matter concerns data model information. Data model information is defined by the XML schema associated with the URN "urn:ietf:params:xml:ns:clue-info". Also for the XML elements defined in such a schema there are extensibility issues. Those issues are overcome by using <any> and <anyAttribute> placeholders. Similarly to what said before, new information within data model elements can be added in place of <any> and <anyAttribute> schema elements, as long as they are properly namespace qualified.

Presta & Romano

Expires August 9, 2015

[Page 26]

On the other hand (second type of extensions), "extra" CLUE protocol messages, i.e., messages not envisioned in the latest standard version of the schema, can be needed. In that case, the messages and the associated behavior should be defined in external documents that both communication parties must be aware of.

Both types of extensions, i.e., new information and new messages, can be characterized by:

- o a name;
- o an external XML Schema defining the XML information and/or the XML messages representing the extension;
- o the standard version of the protocol the extension refers to.

For that reason, the extensions can be represented by means of the `<option>` element as defined below, which is carried within the OPTIONS and OPTIONS RESPONSE messages to represent the extensions supported by the CI and by the CR, respectively.

```
<!-- OPTION TYPE -->
<xs:complexType name="optionType">
<xs:sequence>
<xs:element name="name" type="xs:string" />
<xs:element name="schemaRef" type="xs:anyURI" minOccurs="0"/>
<xs:element name="version" type="versionType" minOccurs="0"/>
<xs:any namespace="#other" processContents="lax" minOccurs="0"/>
</xs:sequence>
<xs:anyAttribute namespace="#other" processContents="lax"/>
</xs:complexType>
```

[9. Details on CLUE Protocol Enhancement](#)

The CLUE protocol may be extended in a number of ways:

1. New values for existing:

- * Media Capture Attributes as defined in [section 7.1.1](#)/
[[I-D.ietf-clue-framework](#)];
- * MCC Attributes as defined in [section 7.2.1](#)/
[[I-D.ietf-clue-framework](#)];

Presta & Romano

Expires August 9, 2015

[Page 27]

- * Capture Scene Attributes as in [section 7.3.1](#)/
[\[I-D.ietf-clue-framework\]](#);
 - * Capture Scene View attributes as in [section 7.3.2](#)/
[\[I-D.ietf-clue-framework\]](#).
2. New Media Capture, MCC, Capture Scene or Capture Scene View attributes
 3. New Error Response Codes
 4. New or modified elements related to the syntax of the CLUE protocol (enhancements not related to CLUE attributes or attribute values).

The CLUE OPTION mechanism is used to indicate support for enhancements related to attributes (i.e., 1 and 2 above).

Enhancements to CLUE protocol syntax as a result of 3 and 4 may require a new protocol version or may use the OPTION mechanism. However the procedure for specifying and registering a syntax related OPTION is different to an OPTION affecting attributes/attribute values. An OPTIONS mechanism is used for syntax that is optional for an endpoint to receive. A new CLUE protocol version is used where updated syntax MUST be supported by an endpoint.

[**9.1. CLUE OPTION registration**](#)

Registrations for CLUE OPTIONS are requested from the IANA. This section outlines the procedures for documenting and registering a new CLUE OPTION.

[**9.1.1. Attribute / Attribute Value related OPTIONS**](#)

The process for registering an attribute/attribute value related CLUE OPTION is deemed to be "specification required" as per [[RFC5226](#)]. Each OPTION may only contain a single new attribute or one or more value additions to an existing attribute.

The specification MUST include the following information:

- o Option Name: String [1-64 Characters].
- o Option Description: A high level text indicating what the CLUE OPTION is for.
- o Specification Reference: A URL to the publicly available document containing the OPTION.

Presta & Romano

Expires August 9, 2015

[Page 28]

- o XML Schema Reference: The XML schema reference
- o Minimum CLUE Version: The minimum version of the CLUE protocol that the OPTION pertains to.
- o Attribute Name: An existing attribute name is used when the OPTION introduces new value/s. A new unique attribute name is used when introducing a new attribute. OPTION requesters SHOULD check the IANA CLUE OPTION registry to ensure that new attributes have a unique name within the attribute type.
- o Attribute Type (optional): When introducing a new attribute the type of attribute, "Media Capture", "MCC", "Capture Scene" or "Capture Scene View" MUST be indicated. It is not possible to change the attribute type of an existing attribute.
- o Attribute Description (optional): This description MUST be included for a new attribute. It describes the functionality associated with the attribute.
- o Value Description: The specification MUST include a description of the new values, including allowed values, values ranges, value type and a description of the values. The introduction of new value/s MUST NOT change the value type (e.g. from string to integer) nor SHOULD it change the meaning of existing values.
- o XML Schema (optional): The specification MUST contain an XML schema detailing the new attribute and its values. If an OPTION describes a new value in an existing value range updates to the XML schema is not required.

Developers of specifications of new CLUE OPTIONS are encouraged to send their specifications to the IETF CLUE working group for comment before requesting registration of a new CLUE OPTION with the IANA.

Once the request for CLUE OPTION registration is received by IANA, it will be forwarded to the Internet Engineering Steering Group (IESG) appointed Expert for review. During the review, the specification with the requested CLUE OPTION will be compared to the above criteria for completeness, as well as being compared against protocol syntax and procedures. It will be compared against existing OPTIONS to see that it does not duplicate existing functionalities. It will be reviewed to see that any potential security issues are addressed. The Expert reviewer will then work towards a resolution of any issues with the OPTIONS requester. The IESG appointed Expert may complete the review in consultation with other CLUE experts (i.e., via email to IETF CLUE email list). If the CLUE OPTION is deemed suitable, the IESG appointed Expert shall issue a statement indicating approval,

Presta & Romano

Expires August 9, 2015

[Page 29]

copied to IANA.

The IESG Expert reviewer will ensure the following is recorded with the IANA for each OPTION:

1. A unique string name is registered for each CLUE OPTION. CLUE OPTION names are allocated on a first come-first served basis if all other conditions are met;
2. The attribute type and name of the affected attribute. This is to facilitate cross checking of OPTIONS to ensure that namespaces and values within a namespace do not overlap;
3. A reference to a specification that describes the OPTION;
4. A contact name, an email and postal addresses for the CLUE OPTIONS requester shall be provided. The contact information shall be updated by the defining organization, as necessary.

9.1.2. Syntax / Response code related OPTIONS

The process for registering a syntax or response code related CLUE OPTION is deemed to be "Standards Action" as per [[RFC5226](#)].

The RFC MUST include the following information:

- o Option Name: String [1-64 Characters].
- o Option Description: A high level text indicating what the CLUE OPTION is for.
- o XML Schema Reference: The XML schema reference.
- o Minimum CLUE Version: The minimum version of the CLUE protocol that the OPTION pertains to.
- o XML Schema Description: A description of the new XML elements and any possible relationship to the existing CLUE protocol elements.
- o XML Schema: The specification MUST contain an XML schema detailing the new syntax. It is not possible to modify or remove existing XML syntax via an OPTIONS specification.
- o The responsible IETF WG SHALL ensure the following is recorded with the IANA for each syntax OPTION:
 1. A unique string name is registered for each CLUE OPTION. CLUE OPTION names are allocated on a first come-first served basis

Presta & Romano

Expires August 9, 2015

[Page 30]

- if all other conditions are met.
2. An indication that the OPTION is related to syntax.
 3. A reference to the RFC that describes the OPTION.

[10. XML Schema](#)

In this section, the XML schema defining the CLUE messages is provided.

```
<?xml version="1.0" encoding="UTF-8" ?>

12. IANA Considerations

This document registers a new XML namespace, a new XML schema and the MIME type for the schema. This document also registers the "CLUE" Application Service tag and the "CLUE" Application Protocol tag and defines registries for the CLUE messages and response codes.

12.1. URN Sub-Namespace Registration

This section registers a new XML namespace, "`urn:ietf:params:xml:ns:clue-protocol`".

Presta & Romano

Expires August 9, 2015

[Page 47]

URI: urn:ietf:params:xml:ns:clue-protocol

Registrant Contact: IETF CLUE working group (clue@ietf.org), Simon Pietro Romano (spromano@unina.it).

XML:

```
BEGIN
<?xml version="1.0"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
 "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml" xml:lang="en">
  <head>
    <title>CLUE Messages</title>
  </head>
  <body>
    <h1>Namespace for CLUE Messages</h1>
    <h2>urn:ietf:params:xml:ns:clue-protocol</h2>
[[NOTE TO IANA/RFC-EDITOR: Please update RFC URL and replace XXXX
with the RFC number for this specification.]]
    <p>See <a href="[[RFC URL]]">
      RFCXXXX</a>.</p>
  </body>
</html>
END
```

[12.2. XML Schema registration](#)

This section registers an XML schema per the guidelines in [\[RFC3688\]](#).

URI: urn:ietf:params:xml:schema:clue-protocol

Registrant Contact: CLUE working group (clue@ietf.org), Simon Pietro Romano (spromano@unina.it).

Schema: The XML for this schema can be found as the entirety of [Section 10](#) of this document.

[12.3. MIME Media Type Registration for 'application/clue+xml'](#)

This section registers the " "application/clue+xml"" MIME type.

To: ietf-types@iana.org

Subject: Registration of MIME media type application/clue+xml

Presta & Romano

Expires August 9, 2015

[Page 48]

MIME media type name: application

MIME subtype name: clue+xml

Required parameters: (none)

Optional parameters: charset

Same as the charset parameter of "application/xml" as specified in
[\[RFC3023\], Section 3.2.](#)

Encoding considerations: Same as the encoding considerations of
"application/xml" as specified in [\[RFC3023\], Section 3.2.](#)

Security considerations: This content type is designed to carry
protocol data related to telepresence session control. Some of the
data could be considered private. This media type does not provide
any protection and thus other mechanisms such as those described in
Section Security are required to protect the data. This media type
does not contain executable content.

Interoperability considerations: None.

Published specification: RFC XXXX [[NOTE TO IANA/RFC-EDITOR: Please
replace XXXX with the RFC number for this specification.]]

Applications that use this media type: CLUE participants.

Additional Information: Magic Number(s): (none),
File extension(s): .clue,
Macintosh File Type Code(s): TEXT.

Person & email address to contact for further information: Simon
Pietro Romano (spromano@unina.it).

Intended usage: LIMITED USE

Author/Change controller: The IETF

Other information: This media type is a specialization of
application/xml [\[RFC3023\]](#), and many of the considerations described
there also apply to application/clue+xml.

[12.4. DNS Registrations](#)

[Section 12.4.1](#) defines an Application Service tag of "CLUE", which is
used to identify the CLUE service. The Application Protocol tag
"CLUE", defined in [Section 12.4.2](#), is used to identify a CLUE
Participant that understands CLUE.

Presta & Romano

Expires August 9, 2015

[Page 49]

12.4.1. Application Service tag

This section registers a new S-NAPTR/U-NAPTR Application Service tag for CLUE, as mandated by [[RFC3958](#)].

Application Service Tag: CLUE

Intended usage: Identifies a server that supports CLUE telepresence conferencing.

Defining publication: RFCXXXX [[NOTE TO IANA/RFC-EDITOR: Please replace XXXX with the RFC number for this specification.]]

Contact information: The authors of this document

Author/Change controller: The IESG

12.4.2. Application Protocol tag

This section registers a new S-NAPTR/U-NAPTR Application Protocol tag for CLUE, as mandated by [[RFC3958](#)].

Application Service Tag: CLUE

Intended Usage: Identifies the CLUE Protocol.

Applicable Service Tag(s): CLUE

Terminal NAPTR Record Type(s): U

Defining Publication: RFC XXXX [[NOTE TO IANA/RFC-EDITOR: Please replace XXXX with the RFC number for this specification.]]

Contact Information: The authors of this document

Author/Change Controller: The IESG

12.5. CLUE Protocol Registry

The document requests that the IANA creates new registries for CLUE messages and response codes.

12.5.1. CLUE Message Types

The following summarizes the registry for CLUE messages:

Related Registry: CLUE Message Types Registry

Presta & Romano

Expires August 9, 2015

[Page 50]

Defining RFC: RFC XXXX [[NOTE TO IANA/RFC-EDITOR: Please replace XXXX with the RFC number for this specification.]]

Registration/Assignment Procedures: Following the policies outlined in [[RFC5226](#)], the IANA policy for assigning new values for the CLUE message types for the CLUE protocol is Specification Required.

Registrant Contact: IETF CLUE working group (clue@ietf.org), Simon Pietro Romano (spromano@unina.it).

The initial Message table is populated using the CLUE messages described in [Section 4](#) and defined in the XML schema in [Section 10](#).

ToDo: table: message description reference

[**12.5.2. CLUE Response Codes**](#)

The following summarizes the requested registry for CLUE response codes:

Related Registry: CLUE Response Code Registry

Defining RFC: RFC XXXX [[NOTE TO IANA/RFC-EDITOR: Please replace XXXX with the RFC number for this specification.]]

Registration/Assignment Procedures: Following the policies outlined in [[RFC5226](#)], the IANA policy for assigning new values for the Response codes for CLUE shall be Specification Required.

Registrant Contact: IETF CLUE working group (clue@ietf.org), Simon Pietro Romano (spromano@unina.it).

The initial Response-code table is populated using the Response codes defined in [Section 4.7](#) as follows:

ToDo: table: number, default response string, description, reference

[**13. Diff with \[draft-ietf-clue-protocol-02\]\(#\)**](#)

- o CLUE Participant state machine: TERMINATED state replaced with IDLE.
- o MP and MC state machines: SDP O/A state removed.
- o Diff mechanism (and related example) removed.
- o Schema updates: versionType used as the data type for all versions fields, xs:unsignedInt used as the data type for all sequence

Presta & Romano

Expires August 9, 2015

[Page 51]

number fields, diff support removed from the ADV definition.

- o Section "Details on CLUE protocol Enhancement" added.

14. Diff with [draft-ietf-clue-protocol-01](#)

- o The diff mechanism for the ADV message has been introduced.
- o READV and READV RESPONSE message have been both removed.
- o The state machines have been deeply reviewed and changed.
- o References: references have been updated and splitted into Informative references and Normative references as in framework v17.
- o Schema: <globalSceneEntries> changed in <globalViews>, <participants> in <people>
- o Terminology: many definitions added.
- o Response codes updated.

15. Diff with [draft-ietf-clue-protocol-00](#)

1. The XML schema of the ADVERTISEMENT and of the READV have been aligned with the current definitions in [[I-D.ietf-clue-data-model-schema](#)] (example of updates: <participants> --> <people>, <globalCaptureEntries> --> <globalSceneEntries>)
2. Text has been added to clarify that, in the OPTIONS RESPONSE, when the response code is not an error response code, both <mediaProvider> and <mediaConsumer> are mandatory.
3. The content of the "v" attribute and of the <version> elements carried in the OPTIONS and OPTIONS RESPONSE messages has been described more precisely.
4. Advertisement examples have been added.

16. Diff with [draft-presta-clue-protocol-04](#)

1. The response code type error in the OPTIONS response (and in other parts) has been corrected.

Presta & Romano

Expires August 9, 2015

[Page 52]

17. Diff with [draft-presta-clue-protocol-03](#)

1. The XML Schema has been deeply revised and completed.
2. The descriptions of the CLUE messages have been added.
3. The distinction between major version numbers and minor version numbers has been cut and pasted from [[I-D.ietf-clue-signaling](#)].
4. Besides the two way one, a three way mechanism for the options negotiation has been proposed and provided to foster discussion.

18. Diff with [draft-presta-clue-protocol-02](#)

1. "Terminology" section added.
2. Introduced the concept of "CLUE Participant" - an Endpoint or a MCU able to use the CLUE protocol within a telepresence session. A CLUE Participant can act as a Media Provider and/or as a Media Consumer.
3. Introduced the ACK/NACK mechanism for the ADVERTISEMENT.
4. MP and MC state machines have been updated. The CP state machine has been added.

19. Acknowledgments

Besides the authors, many people have contributed to this document. The core team focusing on the CLUE protocol consists of: Mary Barnes, Roni Even, Rob Hansen, Christian Groves, Paul Kyzivat. Christian Groves, in particular, has contributed most of the text in [Section 9](#). Scarlett Liuyan has contributed detailed comments and suggestions. The authors would like to thank all WG participants for their precious feedbacks and support.
