Updates to the Opus Audio Codec
draft-ietf-codec-opus-update-08

Abstract

This document addresses minor issues that were found in the specification of the Opus audio codec in [RFC 6716](#).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 27, 2018.

[1.](#) Introduction

This document addresses minor issues that were discovered in the reference implementation of the Opus codec. Unlike most IETF specifications, Opus is defined in [RFC 6716](#) [[RFC6716](#)] in terms of a normative reference decoder implementation rather than from the associated text description. That RFC includes the reference decoder implementation as [Appendix A](#). That's why only issues affecting the decoder are listed here. An up-to-date implementation of the Opus encoder can be found at [<https://opus-codec.org/>](https://opus-codec.org/).

Some of the changes in this document update normative behaviour in a way that requires new test vectors. The English text of the specification is unaffected, only the C implementation is. The updated specification remains fully compatible with the original specification.

Note: due to RFC formatting conventions, lines exceeding the column width in the patch are split using a backslash character. The backslashes at the end of a line and the white space at the beginning of the following line are not part of the patch. A properly formatted patch including all changes is available at <https://www.ietf.org/proceedings/98/slides/materials-98-codec-opus-update-00.patch> and has a SHA1

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

3. Stereo State Reset in SILK

The reference implementation does not reinitialize the stereo state during a mode switch. The old stereo memory can produce a brief impulse (i.e. single sample) in the decoded audio. This can be fixed by changing `silk/dec_API.c` at line 72:

```
<CODE BEGINS>
    for( n = 0; n < DECODER_NUM_CHANNELS; n++ ) {
        ret = silk_init_decoder( &channel_state[ n ] );
    }
+   silk_memset(&((silk_decoder *)decState)->sStereo, 0,
+               sizeof(((silk_decoder *)decState)->sStereo));
+   /* Not strictly needed, but it's cleaner that way */
+   ((silk_decoder *)decState)->prev_decode_only_middle = 0;

    return ret;
}
<CODE ENDS>
```

This change affects the normative output of the decoder, but the amount of change is within the tolerance and too small to make the testvector check fail.

4. Parsing of the Opus Packet Padding

It was discovered that some invalid packets of very large size could trigger an out-of-bounds read in the Opus packet parsing code responsible for padding. This is due to an integer overflow if the signaled padding exceeds $2^{31}-1$ bytes (the actual packet may be

smaller). The code can be fixed by applying the following changes at line 596 of src/opus_decoder.c:

```
<CODE BEGINS>
    /* Padding flag is bit 6 */
    if (ch&0x40)
    {
-       int padding=0;
        int p;
        do {
            if (len<=0)
                return OPUS_INVALID_PACKET;
            p = *data++;
            len--;
-           padding += p==255 ? 254: p;
+           len -= p==255 ? 254: p;
        } while (p==255);
-       len -= padding;
    }
<CODE ENDS>
```

This packet parsing issue is limited to reading memory up to about 60 kB beyond the compressed buffer. This can only be triggered by a compressed packet more than about 16 MB long, so it's not a problem for RTP. In theory, it could crash a file decoder (e.g. Opus in Ogg) if the memory just after the incoming packet is out-of-range, but our attempts to trigger such a crash in a production application built using an affected version of the Opus decoder failed.

5. Resampler buffer

The SILK resampler had the following issues:

1. The calls to `memcpy()` were using `sizeof(opus_int32)`, but the type of the local buffer was `opus_int16`.
2. Because the size was wrong, this potentially allowed the source and destination regions of the `memcpy()` to overlap. We believe that `nSamplesIn` (number of input samples) is at least `fs_in_khZ` (sampling rate in kHz), which is at least 8. Since `RESAMPLER_ORDER_FIR_12` is only 8, that should not be a problem once the type size is fixed.
3. The size of the buffer used `RESAMPLER_MAX_BATCH_SIZE_IN`, but the data stored in it was actually twice the input batch size (`nSamplesIn<<1`).

The fact that the code never produced any error in testing (including when run under the Valgrind memory debugger), suggests that in practice the batch sizes are reasonable enough that none of the

issues above was ever a problem. However, the authors know of no obvious approach to proving that.

The code can be fixed by applying the following changes to line 78 of `silk/resampler_private_IIR_FIR.c`:

<CODE BEGINS>

```
)
{
    silk_resampler_state_struct *S = \
(silk_resampler_state_struct *)SS;
    opus_int32 nSamplesIn;
    opus_int32 max_index_Q16, index_increment_Q16;
-   opus_int16 buf[ RESAMPLER_MAX_BATCH_SIZE_IN + \
RESAMPLER_ORDER_FIR_12 ];
+   opus_int16 buf[ 2*RESAMPLER_MAX_BATCH_SIZE_IN + \
RESAMPLER_ORDER_FIR_12 ];

    /* Copy buffered samples to start of buffer */
-   silk_memcpy( buf, S->sFIR, RESAMPLER_ORDER_FIR_12 \
* sizeof( opus_int32 ) );
+   silk_memcpy( buf, S->sFIR, RESAMPLER_ORDER_FIR_12 \
```

```

* sizeof( opus_int16 ) );

/* Iterate over blocks of frameSizeIn input samples */
index_increment_Q16 = S->invRatio_Q16;
while( 1 ) {
    nSamplesIn = silk_min( inLen, S->batchSize );

    /* Upsample 2x */
    silk_resampler_private_up2_HQ( S->sIIR, &buf[ \
RESAMPLER_ORDER_FIR_12 ], in, nSamplesIn );

    max_index_Q16 = silk_LSHIFT32( nSamplesIn, 16 + 1 \
);
    /* + 1 because 2x upsampling */
    out = silk_resampler_private_IIR_FIR_INTERPOL( out, \
buf, max_index_Q16, index_increment_Q16 );
    in += nSamplesIn;
    inLen -= nSamplesIn;

    if( inLen > 0 ) {
        /* More iterations to do; copy last part of \
filtered signal to beginning of buffer */
        - silk_memcpy( buf, &buf[ nSamplesIn << 1 ], \
RESAMPLER_ORDER_FIR_12 * sizeof( opus_int32 ) );
        + silk_memmove( buf, &buf[ nSamplesIn << 1 ], \
RESAMPLER_ORDER_FIR_12 * sizeof( opus_int16 ) );
    } else {

```

```

        break;
    }
}

/* Copy last part of filtered signal to the state for \
the next call */
- silk_memcpy( S->sFIR, &buf[ nSamplesIn << 1 ], \
RESAMPLER_ORDER_FIR_12 * sizeof( opus_int32 ) );
+ silk_memcpy( S->sFIR, &buf[ nSamplesIn << 1 ], \
RESAMPLER_ORDER_FIR_12 * sizeof( opus_int16 ) );
}
<CODE ENDS>

```

[6.](#) Integer wrap-around in inverse gain computation

It was discovered through decoder fuzzing that some bitstreams could produce integer values exceeding 32-bits in `LPC_inverse_pred_gain_QA()`, causing a wrap-around. Although the error is harmless in practice, the C standard considers the behavior as undefined, so the following patch to line 87 of `silk/LPC_inv_pred_gain.c` detects values that do not fit in a 32-bit integer and considers the corresponding filters unstable:

```
<CODE BEGINS>
    /* Update AR coefficient */
    for( n = 0; n < k; n++ ) {
-       tmp_QA = Aold_QA[ n ] - MUL32_FRAC_Q( \
Aold_QA[ k - n - 1 ], rc_Q31, 31 );
-       Anew_QA[ n ] = MUL32_FRAC_Q( tmp_QA, rc_mult2 , mult2Q );
+       opus_int64 tmp64;
+       tmp_QA = silk_SUB_SAT32( Aold_QA[ n ], MUL32_FRAC_Q( \
Aold_QA[ k - n - 1 ], rc_Q31, 31 ) );
+       tmp64 = silk_RSHIFT_ROUND64( silk_SMULL( tmp_QA, \
rc_mult2 ), mult2Q);
+       if( tmp64 > silk_int32_MAX || tmp64 < silk_int32_MIN ) {
+           return 0;
+       }
+       Anew_QA[ n ] = ( opus_int32 )tmp64;
    }
<CODE ENDS>
```

[7.](#) Integer wrap-around in LSF decoding

It was discovered -- also from decoder fuzzing -- that an integer wrap-around could occur when decoding line spectral frequency coefficients from extreme bitstreams. The end result of the wrap-around is an illegal read access on the stack, which the authors do not believe is exploitable but should nonetheless be fixed. The

following patch to line 137 of `silk/NLSF_stabilize.c` prevents the problem:

```
<CODE BEGINS>
    /* Keep delta_min distance between the NLSFs */
    for( i = 1; i < L; i++ )
-       NLSF_Q15[i] = silk_max_int( NLSF_Q15[i], \
NLSF_Q15[i-1] + NDeltaMin_Q15[i] );
```

```

+           NLSF_Q15[i] = silk_max_int( NLSF_Q15[i], \
silk_ADD_SAT16( NLSF_Q15[i-1], NDeltaMin_Q15[i] ) );

        /* Last NLSF should be no higher than 1 - NDeltaMin[L] */
<CODE ENDS>

```

8. Cap on Band Energy

On extreme bit-streams, it is possible for log-domain band energy levels to exceed the maximum single-precision floating point value once converted to a linear scale. This would later cause the decoded values to be NaN (not a number), possibly causing problems in the software using the PCM values. This can be avoided with the following patch to line 552 of `celt/quant_bands.c`:

```

<CODE BEGINS>
    {
        opus_val16 lg = ADD16(oldEBands[i+c*m->nbEBands],
                               SHL16((opus_val16)eMeans[i],6));
+       lg = MIN32(QCONST32(32.f, 16), lg);
        eBands[i+c*m->nbEBands] = PSHR32(celt_exp2(lg),4);
    }
    for (;i<m->nbEBands;i++)
<CODE ENDS>

```

9. Hybrid Folding

When encoding in hybrid mode at low bitrate, we sometimes only have enough bits to code a single CELT band (8 - 9.6 kHz). When that happens, the second band (CELT band 18, from 9.6 to 12 kHz) cannot use folding because it is wider than the amount already coded, and falls back to white noise. Because it can also happen on transients (e.g. stops), it can cause audible pre-echo.

To address the issue, we change the folding behavior so that it is never forced to fall back to LCG due to the first band not containing enough coefficients to fold onto the second band. This is achieved by simply repeating part of the first band in the folding of the second band. This changes the code in `celt/bands.c` around line 1237:

```

<CODE BEGINS>

```

```

        b = 0;
    }

-     if (resynth && M*eBands[i]-N >= M*eBands[start] && \
(update_lowband || lowband_offset==0))
+     if (resynth && (M*eBands[i]-N >= M*eBands[start] || \
i==start+1) && (update_lowband || lowband_offset==0))
        lowband_offset = i;

+     if (i == start+1)
+     {
+         int n1, n2;
+         int offset;
+         n1 = M*(eBands[start+1]-eBands[start]);
+         n2 = M*(eBands[start+2]-eBands[start+1]);
+         offset = M*eBands[start];
+         /* Duplicate enough of the first band folding data to \
be able to fold the second band.
+         Copies no data for CELT-only mode. */
+         OPUS_COPY(&norm[offset+n1], &norm[offset+2*n1 - n2], n2-n1);
+         if (C==2)
+             OPUS_COPY(&norm2[offset+n1], &norm2[offset+2*n1 - n2], \
n2-n1);
+     }
+
+     tf_change = tf_res[i];
+     if (i>=m->effEBands)
+     {
<CODE ENDS>

```

as well as line 1260:

```

<CODE BEGINS>
    fold_start = lowband_offset;
    while(M*eBands[--fold_start] > effective_lowband);
    fold_end = lowband_offset-1;
-    while(M*eBands[++fold_end] < effective_lowband+N);
+    while(++fold_end < i && M*eBands[fold_end] < \
effective_lowband+N);
    x_cm = y_cm = 0;
    fold_i = fold_start; do {
        x_cm |= collapse_masks[fold_i*C+0];

<CODE ENDS>

```

The fix does not impact compatibility, because the improvement does not depend on the encoder doing anything special. There is also no

reasonable way for an encoder to use the original behavior to improve quality over the proposed change.

10. Downmix to Mono

The last issue is not strictly a bug, but it is an issue that has been reported when downmixing an Opus decoded stream to mono, whether this is done inside the decoder or as a post-processing step on the stereo decoder output. Opus intensity stereo allows optionally coding the two channels 180-degrees out of phase on a per-band basis. This provides better stereo quality than forcing the two channels to be in phase, but when the output is downmixed to mono, the energy in the affected bands is cancelled sometimes resulting in audible artefacts.

As a work-around for this issue, the decoder MAY choose not to apply the 180-degree phase shift when the output is meant to be downmixed (inside or outside of the decoder).

11. New Test Vectors

Changes in [Section 9](#) and [Section 10](#) have sufficient impact on the testvectors to make them fail. For this reason, this document also updates the Opus test vectors. The new test vectors now include two decoded outputs for the same bitstream. The outputs with suffix 'm' do not apply the CELT 180-degree phase shift as allowed in [Section 10](#), while the outputs without the suffix do. An implementation is compliant as long as it passes either set of vectors.

In addition, any Opus implementation that passes the original test vectors from [RFC 6716](#) [[RFC6716](#)] is still compliant with the Opus specification. However, newer implementations SHOULD be based on the new test vectors rather than the old ones.

The new test vectors are located at <https://www.ietf.org/proceedings/98/slides/materials-98-codec-opus-newvectors-00.tar.gz>. The SHA1 hash of the test vectors are:

Note that the decoder input bitstream files (.bit) are unchanged.

12. Security Considerations

This document fixes two security issues reported on Opus and that affect the reference implementation in [RFC 6716](#) [[RFC6716](#)]: CVE-2013-0899 <<https://nvd.nist.gov/vuln/detail/CVE-2013-0899>> and CVE-2017-0381 <<https://nvd.nist.gov/vuln/detail/CVE-2017-0381>>. CVE-2013-0899 is fixed by [Section 4](#) and could theoretically cause information leak, but the leaked information would at the very least

[Page 10]

Internet-Draft

Opus Update

July 2017

go through the decoder process before being accessible to the attacker. Also, the bug can only be triggered by Opus packets at least 24 MB in size. CVE-2017-0381 is fixed by [Section 7](#) and, as far as the authors are aware, could not be exploited in any way (despite the claims in the CVE) unless the read-only table was somehow placed very close to sensitive data, which is highly unlikely. Beyond the two fixed CVEs, this document adds no new security considerations on top of [RFC 6716](#) [[RFC6716](#)].

13. IANA Considerations

This document makes no request of IANA.

Note to RFC Editor: this section may be removed on publication as an RFC.

14. Acknowledgements

We would like to thank Juri Aedla for reporting the issue with the parsing of the Opus padding. Thanks to Felicia Lim for reporting the LSF integer overflow issue. Also, thanks to Tina le Grand, Jonathan Lennox, and Mark Harris for their feedback on this document.
