DetNet Data Plane: IEEE 802.1 Time Sensitive Networking over MPLS
draft-ietf-detnet-tsn-vpn-over-mpls-03

Abstract

   This document specifies the Deterministic Networking data plane when
   TSN networks are interconnected over a DetNet MPLS Network.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at https://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months
   and may be updated, replaced, or obsoleted by other documents at any
   time. It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on December 10, 2020.

Table of Contents

1. Introduction

The Time-Sensitive Networking Task Group (TSN TG) within IEEE 802.1
Working Group deals with deterministic services through IEEE 802
networks. Deterministic Networking (DetNet) defined by IETF is a
service that can be offered by a L3 network to DetNet flows. General
background and concepts of DetNet can be found in [RFC8655].

This document specifies the use of a DetNet MPLS network to
interconnect TSN nodes/network segments. DetNet MPLS data plane is
defined in [I-D.ietf-detnet-mpls].

2. Terminology

2.1. Terms Used in This Document

This document uses the terminology and concepts established in the
DetNet architecture [RFC8655] and
[I-D.ietf-detnet-data-plane-framework], and [I-D.ietf-detnet-mpls].
The reader is assumed to be familiar with these documents and their
terminology.

2.2. Abbreviations

The following abbreviations are used in this document:

AC   Attachment Circuit.

CE   Customer Edge equipment.

CW   Control Word.

DetNet   Deterministic Networking.

DF   DetNet Flow.

FRER   Frame Replication and Elimination for Redundancy (TSN
            function).

L2   Layer 2.

L2VPN   Layer 2 Virtual Private Network.

L3   Layer 3.

LSR   Label Switching Router.

MPLS   Multiprotocol Label Switching.

MPLS-TE   Multiprotocol Label Switching - Traffic Engineering.

MPLS-TP   Multiprotocol Label Switching - Transport Profile.

NSP   Native Service Processing.

OAM   Operations, Administration, and Maintenance.

PE   Provider Edge.

PREOF   Packet Replication, Elimination and Ordering Functions.

PW   PseudoWire.

S-PE   Switching Provider Edge.

T-PE   Terminating Provider Edge.

TSN   Time-Sensitive Network.

2.3. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
"OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all
capitals, as shown here.

3. IEEE 802.1 TSN Over DetNet MPLS Data Plane Scenario

Figure 1 shows IEEE 802.1 TSN end stations operating over a TSN aware
DetNet service running over an MPLS network. DetNet Edge Nodes sit
at the boundary of a DetNet domain. They are responsible for mapping
non-DetNet aware L2 traffic to DetNet services. They also support
the imposition and disposition of the required DetNet encapsulation.
These are functionally similar to pseudowire (PW) Terminating
Provider Edge (T-PE) nodes which use MPLS-TE LSPs. In this example
TSN Streams are simple applications over DetNet flows. The specific
of this operation are discussed later in this document.

```
    TSN             Edge            Transit          Edge            TSN
 End System         Node            Node             Node         End System
                    (T-PE)          (LSR)            (T-PE)

                         `-----'                      `-----'

               |<------ DetNet MPLS ------>|
         |<--------------------- TSN   --------------------->|
```
                Figure 1: A TSN over DetNet MPLS Enabled Network

   In this example, edge nodes provide a service proxy function that
   "associates" the DetNet flows and native flows (i.e., TSN Streams) at
   the edge of the DetNet domain. TSN streams are treated as App-flows
   for DetNet. The whole DetNet domain behaves as a TSN relay node for
   the TSN streams. The service proxy behaves as a port of that TSN
   relay node.

   Figure 2 illustrates how DetNet can provide services for IEEE 802.1
   TSN end systems, CE1 and CE2, over a DetNet enabled MPLS network.
   Edge nodes, E1 and E2, insert and remove required DetNet data plane
   encapsulation. The 'X' in the edge nodes and relay node, R1,
   represent a potential DetNet compound flow packet replication and
   elimination point. This conceptually parallels L2VPN services, and
   could leverage existing related solutions as discussed below.

```
         TSN    |<------- End to End DetNet Service ------>|  TSN
       Service  |           Transit          Transit       | Service
  TSN  (AC)     |        |<-Tnl->|         |<-Tnl->|        |  (AC)  TSN
  End    |      V        V   1 V         V   2  V           V  |      End

```
                Figure 2: IEEE 802.1TSN Over DetNet

4. DetNet MPLS Data Plane

4.1. Overview

   The basic approach defined in [I-D.ietf-detnet-mpls] supports the
   DetNet service sub-layer based on existing pseudowire (PW)
   encapsulations and mechanisms, and supports the DetNet forwarding
   sub-layer based on existing MPLS Traffic Engineering encapsulations
   and mechanisms.

   A node operating on a DetNet flow in the Detnet service sub-layer,
   i.e. a node processing a DetNet packet which has the S-Label as top
   of stack uses the local context associated with that S-Label, for
   example a received F-Label, to determine what local DetNet
   operation(s) are applied to that packet. An S-Label may be unique
   when taken from the platform label space [RFC3031], which would
   enable correct DetNet flow identification regardless of which input
   interface or LSP the packet arrives on. The service sub-layer
   functions (i.e., PREOF) use a DetNet control word (d-CW).

   The DetNet MPLS data plane builds on MPLS Traffic Engineering
   encapsulations and mechanisms to provide a forwarding sub-layer that
   is responsible for providing resource allocation and explicit routes.

The forwarding sub-layer is supported by one or more forwarding
labels (F-Labels).

DetNet edge/relay nodes are DetNet service sub-layer aware,
understand the particular needs of DetNet flows and provide both
DetNet service and forwarding sub-layer functions. They add, remove
and process d-CWs, S-Labels and F-labels as needed. MPLS enabled
DetNet nodes can enhance the reliability of delivery by enabling the
replication of packets where multiple copies, possibly over multiple
paths, are forwarded through the DetNet domain. They can also
eliminate surplus previously replicated copies of DetNet packets.
MPLS (DetNet) nodes also include DetNet forwarding sub-layer
functions, support for notably explicit routes, and resources
allocation to eliminate (or reduce) congestion loss and jitter.

DetNet transit nodes reside wholly within a DetNet domain, and also
provide DetNet forwarding sub-layer functions in accordance with the
performance required by a DetNet flow carried over an LSP. Unlike
other DetNet node types, transit nodes provide no service sub-layer
processing.

4.2. TSN over DetNet MPLS Encapsulation

The basic encapsulation approach is to treat a TSN Stream as an App-
flow from the DetNet MPLS perspective. The corresponding example
shown in Figure 3.

```
              /->      +------+  +------+  +------+    TSN      ^ ^
              |        |  X   |  |  X   |  |  X   |<- Appli    : :
  App-Flow <-+         +------+  +------+  +------+    cation  : :(1)
   for MPLS  |         |TSN-L2|  |TSN-L2|  |TSN-L2|            : v
              \-> +---+======+--+======+--+======+-----+      :
                  | d-CW |  | d-CW |  | d-CW |                 :
  DetNet-MPLS      +------+  +------+  +------+                :(2)
                  |Labels|  |Labels|  |Labels|                v
              +---+======+--+======+--+======+-----+
  Link/Sub-Network  | L2  |  | TSN  |  | UDP  |
                  +------+  +------+  +------+
                                     |  IP  |
                                     +------+
                                     |  L2  |
                                     +------+
       (1) TSN Stream
       (2) DetNet MPLS Flow

          Figure 3: Example TSN over MPLS Encapsulation Formats
```

In the figure, "Application" indicates the application payload
carried by the TSN network. "MPLS App-Flow" indicates that the TSN
Stream is the payload from the perspective of the DetNet MPLS data
plane defined in [I-D.ietf-detnet-mpls]. A single DetNet MPLS flow
can aggregate multiple TSN Streams.

5. TSN over MPLS Data Plane Procedures

Description of Edge Nodes procedures and functions for TSN over
DetNet MPLS scenario follows the concept of [RFC3985] and covers the
Edge Nodes components shown on Figure 1. In this section the
following procedures of DetNet Edge Nodes are described:

o TSN related (Section 5.1)

o DetNet Service Proxy (Section 5.2)

o DetNet service and forwarding sub-layer (Section 5.3)

The sub-sections describe procedures for forwarding packets by DetNet
Edge nodes, where such packets are received from either directly
connected CEs (TSN nodes) or some other DetNet Edge nodes.

5.1. Edge Node TSN Procedures

The Time-Sensitive Networking (TSN) Task Group of the IEEE 802.1
Working Group have defined (and are defining) a number of amendments
to IEEE 802.1Q [IEEE8021Q] that provide zero congestion loss and
bounded latency in bridged networks. IEEE 802.1CB [IEEE8021CB]
defines packet replication and elimination functions for a TSN
network.

The implementation of TSN entity (i.e., TSN packet processing
functions) MUST be compliant with the relevant IEEE 802.1 standards.

TSN specific functions are executed on the data received by the
DetNet Edge Node from the connected CE before forwarded to connected
CE(s) or presentation to the DetNet Service Proxy function for
transmission across the DetNet domain, or on the data received from a
DetNet PW by a PE before it is output on the Attachment Circuit(s)
(AC).

TSN packet processing function(s) of Edge Nodes (T-PE) are belonging
to the native service processing (NSP) [RFC3985] block. This is
similar to other functionalities being defined by standard bodies
other than the IETF (for example in case of Ethernet: stripping,
overwriting or adding VLAN tags, etc.). Depending on the TSN role of

the Edge Node in the end-to-end TSN service selected TSN functions
are supported.

When a PE receives a packet from a CE, on a given AC with DetNet
service, it MUST first check via Stream Identification (see Clause 6.
of IEEE 802.1CB [IEEE8021CB] and IEEE P802.1CBdb [IEEEP8021CBdb])
whether the packet belongs to a configured TSN Stream (i.e., App-flow
from DetNet perspective). If no Stream ID is matched and no other
(VPN) service is configured for the AC then packet MUST be dropped.
If there is a matching TSN Stream then the Stream-ID specific TSN
functions MUST be executed (e.g., ingress policing, header field
manipulation in case of active Stream Identification, FRER, etc.).
Source MAC lookup MAY also be used for local MAC address learning.

If the PE decides to forward the packet, the packet MUST be forwarded
according to the TSN Stream specific configuration to connected CE(s)
(in case of local bridging) and/or to the DetNet Service Proxy (in
case of forwarding to remote CE(s) required). If there are no TSN
Stream specific forwarding configurations the PE MUST flood the
packet to other locally attached CE(s) and to the DetNet Service
Proxy. If the administrative policy on the PE does not allow
flooding the PE MUST drop the packet.

When a TSN entity of the PE receives a packet from the DetNet Service
Proxy, it MUST first check via Stream Identification (see Clause 6.
of IEEE 802.1CB [IEEE8021CB] and IEEE P802.1CBdb [IEEEP8021CBdb])
whether the packet belongs to a configured TSN Stream. If no Stream
ID is matched then packet MUST be dropped. If there is a matching
TSN Stream then the Stream ID specific TSN functions MUST be executed
(e.g., header field manipulation in case of active Stream
Identification, FRER, etc.). Source MAC lookup MAY also be used for
local MAC address learning.

If the PE decides to forward the packet, the packet MUST be forwarded
according to the TSN Stream specific configuration to connected
CE(s). If there are no TSN Stream specific forwarding configurations
the PE MUST flood the packet to locally attached CE(s). If the
administrative policy on the PE does not allow flooding the PE MUST
drop the packet.

Implementations of this document SHALL use management and control
information to ensure TSN specific functions of the Edge Node
according to the expectations of the connected TSN network.

5.2. Edge Node DetNet Service Proxy Procedures

The Service Proxy function maps between App-flows and DetNet flows.
The DetNet Edge Node TSN entity MUST support the TSN Stream
identification functions and the related managed objects as defined
in Clause 6. and Clause 9. of IEEE 802.1CB [IEEE8021CB] and IEEE
P802.1CBdb [IEEEP8021CBdb] to recognize the App-flow related packets.
The Service Proxy presents TSN Streams as an App-flow to a DetNet
Flow.

When a DetNet Service Proxy receives a packet from the TSN Entity it
MUST check whether such an App-flow is present in its mapping table.
If present it associates the internal DetNet flow-ID to the packet
and MUST forward it to the DetNet Service and Forwarding sub-layers.
If no matching statement is present it MUST drop the packet.

When a DetNet Service Proxy receives a packet from the DetNet Service
and Forwarding sub-layers it MUST be forwarded to the Edge Node TSN
Entity.

Implementations of this document SHALL use management and control
information to map a TSN Stream to a DetNet flow. N:1 mapping
(aggregating multiple TSN Streams in a single DetNet flow) SHALL be
supported. The management or control function that provisions flow
mapping SHALL ensure that adequate resources are allocated and
configured to provide proper service requirements of the mapped
flows.

Due to the (intentional) similarities of the DetNet PREOF and TSN
FRER functions service protection function interworking is possible
between the TSN and the DetNet domains. Such service protection
interworking scenarios MAY require to copy sequence number fields
from TSN (L2) to PW (MPLS) encapsulation. However, such interworking
is out-of-scope in this document and left for further study.

A MPLS DetNet flow is configured to carry any number of TSN flows.
The DetNet flow specific bandwidth profile SHOULD match the required
bandwidth of the App-flow aggregate.

5.3. Edge Node DetNet Service and Forwarding Sub-Layer Procedures

In the design of [I-D.ietf-detnet-mpls] an MPLS service label (the
S-Label), similar to a pseudowire (PW) label [RFC3985], is used to
identify both the DetNet flow identity and the payload MPLS payload
type. The DetNet sequence number is carried in the DetNet Control
word (d-CW) which carries the Data/OAM discriminator as well. In
[I-D.ietf-detnet-mpls] two sequence number sizes are supported: a 16
bit sequence number and a 28 bit sequence number.

   PREOF functions and the provided service recovery is available only
   within the DetNet domain as the DetNet flow-ID and the DetNet
   sequence number are not valid outside the DetNet network. MPLS
   (DetNet) Edge node terminates all related information elements
   encoded in the MPLS labels.

   The LSP used to forward the DetNet packet may be of any type (MPLS-
   LDP, MPLS-TE, MPLS-TP [RFC5921], or MPLS-SR [RFC8660]). The LSP
   (F-Label) label and/or the S-Label may be used to indicate the queue
   processing as well as the forwarding parameters.

   When a PE receives a packet from the Service Proxy function it MUST
   add to the packet the DetNet flow-ID specific S-label and create a
   d-CW. The PE MUST forward the packet according to the configured
   DetNet Service and Forwarding sub-layer rules to other PE nodes.

   When a PE receives an MPLS packet from a remote PE, then, after
   processing the MPLS label stack, if the top MPLS label ends up being
   a DetNet S-label that was advertised by this node, then the PE MUST
   forward the packet according to the configured DetNet Service and
   Forwarding sub-layer rules to other PE nodes or via the Detnet
   Service Proxy function towards locally connected CE(s).

   For further details on DetNet Service and Forwarding sub-layers see
   [I-D.ietf-detnet-mpls].

6. Controller Plane (Management and Control) Considerations

   TSN Stream(s) to DetNet flow mapping related information are required
   only for the service proxy function of MPLS (DetNet) Edge nodes.
   From the Data Plane perspective there is no practical difference
   based on the origin of flow mapping related information (management
   plane or control plane).

   The following summarizes the set of information that is needed to
   configure TSN over DetNet MPLS:

   o TSN related configuration information according to the TSN role of
      the DetNet MPLS node, as per [IEEE8021Q], [IEEE8021CB] and
      [IEEEP8021CBdb].

   o DetNet MPLS related configuration information according to the
      DetNet role of the DetNet MPLS node, as per
      [I-D.ietf-detnet-mpls].

   o App-Flow identification information to map received TSN Stream(s)
      to the DetNet flow. Parameters fo TSN stream identification are
      defined in [IEEE8021CB] and [IEEEP8021CBdb].

This information MUST be provisioned per DetNet flow.

MPLS DetNet Edge nodes are member of both the DetNet domain and the connected TSN network. From the TSN network perspective the MPLS (DetNet) Edge node has a "TSN relay node" role, so TSN specific management and control plane functionalities must be implemented. There are many similarities in the management plane techniques used in DetNet and TSN, but that is not the case for the control plane protocols. For example, RSVP-TE and MSRP behaves differently. Therefore management and control plane design is an important aspect of scenarios, where mapping between DetNet and TSN is required.

Note that, as the DetNet network is just a portion of the end to end TSN path (i.e., single hop from Ethernet perspective), some parameters (e.g., delay) may differ significantly. Since there is no interworking function the bandwidth of DetNet network is assumed to be set large enough to handle all TSN Flows it will support. At the egress of the Detnet Domain the MPLS headers are stripped and the TSN flow continues on as a normal TSN flow.

In order to use a DetNet network to interconnect TSN segments, TSN specific information must be converted to DetNet domain specific ones. TSN Stream ID(s) and stream(s) related parameters/requirements must be converted to a DetNet flow-ID and flow related parameters/ requirements.

In some case it may be challenging to determine some egress node related information. For example, it may be not trivial to locate the egress point/interface of a TSN Streams with a multicast destination MAC address. Such scenarios may require interaction between control and management plane functions and between DetNet and TSN domains.

Mapping between DetNet flow identifiers and TSN Stream identifiers, if not provided explicitly, can be done by the service proxy function of an MPLS (DetNet) Edge node locally based on information provided for configuration of the TSN Stream identification functions (e.g., Mask-and-Match Stream identification).

Triggering the setup/modification of a DetNet flow in the DetNet network is an example where management and/or control plane interactions are required between the DetNet and the TSN network.

Configuration of TSN specific functions (e.g., FRER) inside the TSN network is a TSN domain specific decision and may not be visible in the DetNet domain. Service protection interworking scenarios are left for further study.

7. Security Considerations

   Security considerations for DetNet are described in detail in
   [I-D.ietf-detnet-security]. General security considerations are
   described in [RFC8655].

   DetNet MPLS data plane specific considerations are summarized and
   described in [I-D.ietf-detnet-mpls] including any application flow
   types. This document focuses on the scenario where TSN Streams are
   the application flows for DetNet and it is already covered by those
   DetNet MPLS data plane security considerations.

8. IANA Considerations

   This document makes no IANA requests.
