Deterministic Networking (DetNet) Configuration YANG Model
draft-ietf-detnet-yang-04

Abstract

This document contains the specification for Deterministic Networking flow configuration YANG Model. The model allows for provisioning of end-to-end DetNet service along the path without dependency on any signaling protocol.

The YANG module defined in this document conforms to the Network Management Datastore Architecture (NMDA).

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 7, 2020.

1. Introduction

DetNet (Deterministic Networking) provides a capability to carry specified unicast or multicast data flows for real-time applications with extremely low packet loss rates and assured maximum end-to-end delivery latency. A description of the general background and concepts of DetNet can be found in [[I-D.ietf-detnet-architecture](#)].

This document defines a YANG model for DetNet based on YANG data types and modeling language defined in [[RFC6991](#)] and [[RFC7950](#)], which includes DetNet service module and DetNet configuration module, and YANG model for topology discovery is defined in [[I-D.ietf-detnet-topology-yang](#)]. DetNet service module is designed for describe characteristics of services being provided for application flows over a network, while the DetNet configuration module is designed for DetNet flow path establishment, flow status reporting, and DetNet functions configuration in order to achieve end-to-end bounded latency and zero congestion loss.

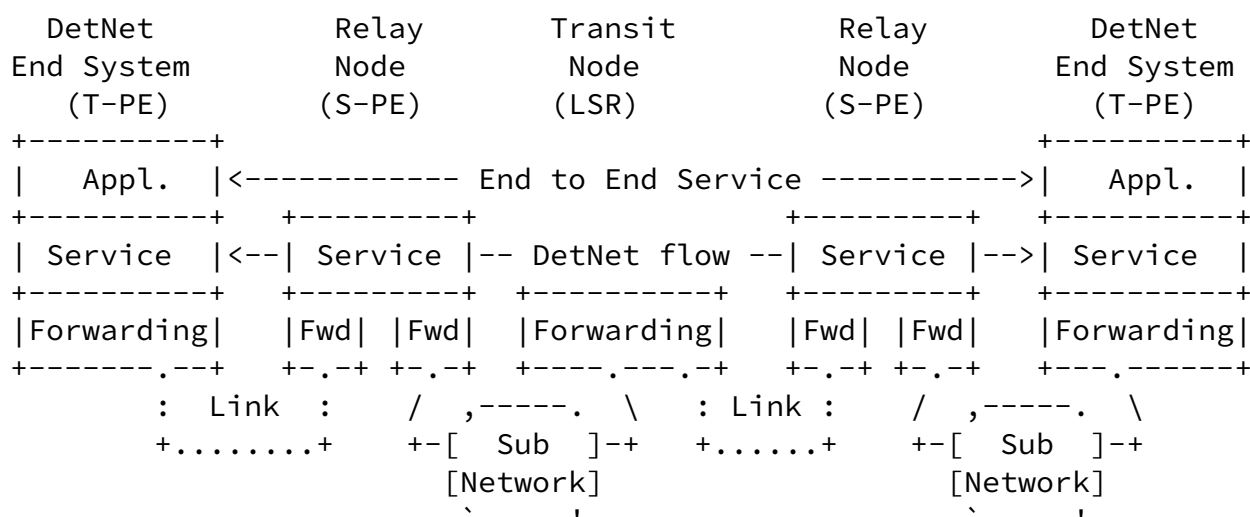

Figure 1: An End-to-end DetNet-Enabled Network

As showed in the picture, in an end-to-end DetNet-enabled network, application flow is carried over a DetNet service and the DetNet service is instantiated as different configuration parameters in different network device along the path. DetNet service is an abstract concept for service provider, and DetNet configuration needs device specific attributes. YANG Models for DetNet service and DetNet configuration are defined in detail respectively in [section 3](#) and [section 4](#).

Editor's notes:

Detnet YANG model and DetNet information model are supposed to keep the same structure and describes the same attributes by different methods. But the design of these two models are still under discussion. The divergence will be settled in the following versions.

[2.](#) Terminologies

This documents uses the terminologies defined in [\[I-D.ietf-detnet-architecture\]](#).

[3.](#) DetNet Service Module

DetNet Service Module includes service quality attributes, service endpoints attributes and service encapsulation type attributes, which are defined in [Section 3.1](#), 3.2, 3.3 respectively.

[3.1.](#) Service Quality

DetNet service quality includes the following attributes:

- o Maximum Latency: MaxLatency is the maximum latency from Ingress to Egress(es) for a single packet of the DetNet flow. MaxLatency is specified as an integer number of nanoseconds.
- o Maximum Latency Variation: MaxLatencyVariation is the difference between the minimum and the maximum end-to-end one-way latency. MaxLatencyVariation is specified as an integer number of nanoseconds.

- o **Maximum Loss:** MaxLoss defines the maximum Packet Loss Ratio (PLR) parameter for the DetNet service between the Ingress and Egress(es) of the DetNet domain.
- o **Maximum Consecutive Loss:** Maximum Consecutive Loss defines the consecutive packet loss number.
- o **Maximum Misordering:** MaxMisordering describes the maximum number of packets that can be received out of order.

[3.2.](#) Service Endpoints

Endpoints attribute defines the starting and termination reference points of the DetNet flow by pointing to the ingress interface/node and egress interface(s)/node(s).

[3.3.](#) Service Encapsulation

Service Encapsulation attribute defines the data plane type of the DetNet service in a DetNet domain, e.g., MPLS, IP.

Editor's notes: DetNet service module is just defined in the document and the yang model is still under work.

[4.](#) DetNet Configuration Module

DetNet configuration module includes DetNet App-flow configuration, DetNet Service Sub-layer configuration, and DetNet Forwarding Sub-layer configuration and DetNet sub-network. The corresponding attributes used in different sub-layers are defined in [Section 3.1](#), 3.2, 3.3, 3.4 respectively.

[4.1.](#) DetNet Application Flow Configuration Attributes

DetNet application flow is responsible for mapping between application flows and DetNet flows at the edge node(egress/ingress node). Where the application flows can be either layer 2 or layer 3 flows. To identify a flow at the User Network Interface (UNI), as

defined in [[I-D.ietf-detnet-flow-information-model](#)], the following flow attributes are introduced:

- o DetNet L3 Flow Identification, refers to Section 7.1.1 of [[I-D.ietf-detnet-flow-information-model](#)]
- o DetNet L2 Flow Identification, refers to Section 7.1.2 of [[I-D.ietf-detnet-flow-information-model](#)]

Application flow can also do flow filtering and policing at the ingress to prevent the misbehaved flows from going into the network, which needs:

- o Traffic Specification, refers to Section 7.2 of [[I-D.ietf-detnet-flow-information-model](#)]

4.2. DetNet Service Sub-layer Configuration Attributes

DetNet service functions, e.g., DetNet tunnel initialization/termination and service protection, are provided in DetNet service sub-layer. To support these functions, the following service attributes need to be configured:

- o DetNet flow identification, refers to Section 8.1.3 of [[I-D.ietf-detnet-flow-information-model](#)].

- o Service function indication, indicates which service function will be invoked at a DetNet edge, relay node or end station. (DetNet tunnel initialization or termination are default functions in DetNet service layer, so there is no need for explicit indication.)
- o Flow Rank, refers to Section 8.3 of [[I-D.ietf-detnet-flow-information-model](#)].
- o Service Rank, refers to Section 16 of [[I-D.ietf-detnet-flow-information-model](#)].
- o Service Sub-layer, refers to [Section 4.5](#) and Section 4.6 of [[I-D.ietf-detnet-mpls](#)]

- o Forwarding Sub-layer, refers to Section 4.3 of [\[I-D.ietf-detnet-ip\]](#) and [Section 4.5](#) and [Section 4.6](#) of [\[I-D.ietf-detnet-mpls\]](#)

[4.3.](#) DetNet Forwarding Sub-layer Configuration Attributes

As defined in [\[I-D.ietf-detnet-architecture\]](#), DetNet forwarding sub-layer optionally provides congestion protection for DetNet flows over paths provided by the underlying network. Explicit route is another mechanism that is used by DetNet to avoid temporary interruptions caused by the convergence of routing or bridging protocols, and it is also implemented at the DetNet forwarding sub-layer.

To support congestion protection and explicit route, the following transport layer related attributes are necessary:

- o Traffic Specification, refers to Section 7.2 of [\[I-D.ietf-detnet-flow-information-model\]](#). It may be used for bandwidth reservation, flow shaping, filtering and policing.
- o Explicit path, existing explicit route mechanisms can be reused. For example, if Segment Routing (SR) tunnel is used as the transport tunnel, the configuration is mainly at the ingress node of the transport layer; if the static MPLS tunnel is used as the transport tunnel, the configurations need to be at every transit node along the path; for pure IP based transport tunnel, it's similar to the static MPLS case.

[4.4.](#) DetNet Sub-network Configurations Attributes

TBD

[5.](#) Overview of DetNet YANG

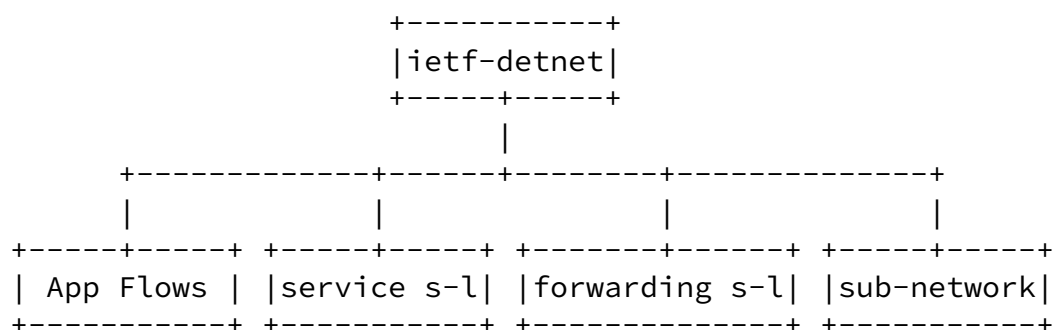

[5.1.](#) DetNet YANG Considerations

[5.1.1.](#) DetNet Service YANG Considerations

TBD

5.1.2. DetNet Configuration YANG Considerations

The picture shows that the general structure of the DetNet YANG Model:

There are four instances in DetNet YANG Model: App-flow instance, service sub-layer instance, forwarding sub-layer instance and sub-network instance, respectively corresponding to four parts of DetNet functions defined in [section 3](#). In each instance, there are four elements: name, in-segments, out-segments and operations, which means:

- o Name: indicates the key value of the instance identification.
- o In-segments: indicates the key value of identification, e.g., Layer 2 App flow identification, Layer 3 App flow identification and DetNet flow identification.
- o Out-segments: indicates the information of DetNet processing(e.g., DetNet forwarding, DetNet header Encapsulation) and the mapping relationship to the lower sub-layer/sub-network.
- o Operations: indicates DetNet functions, e.g., DetNet forwarding functions, DetNet Service functions, DetNet Resource Reservation.

These elements are different when the technologies used for the specific instance is different. So this structure is abstract, which allows for different technology specifics as defined in different data plane drafts.

<CODE ENDS>

[8.](#) Open Issues

There are some open issues that are still under discussion:

- o The Relationship with 802.1 TSN YANG models is TBD. TSN YANG models include: P802.1Qcw, which defines TSN YANG for Qbv, Qbu, and Qci, and P802.1CBcv, which defines YANG for 802.1CB. The possible problem here is how to avoid possible overlap among yang models defined in IETF and IEEE. A common YANG model may be defined in the future to shared by both TSN and DetNet. More discussion are needed here.
- o How to support DetNet OAM is TBD.

These issues will be resolved in the following versions of the draft.

[9.](#) IANA Considerations

This document makes no request of IANA.
