YANG Data Model for DHCPv6 Configuration
draft-ietf-dhc-dhcpv6-yang-25

Abstract

This document describes YANG data modules for the configuration and management of DHCPv6 (Dynamic Host Configuration Protocol for IPv6 [RFC8415](#)) servers, relays, and clients.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 8 September 2022.

[1. Introduction](#)

DHCPv6 [[RFC8415](#)] is used for supplying configuration and other relevant parameters to clients in IPv6 networks. This document defines YANG [[RFC7950](#)] modules for the configuration and management of DHCPv6 'element' (servers, relays, and clients) using the Network Configuration Protocol (NETCONF [[RFC6241](#)]) or RESTCONF [[RFC8040](#)] protocols.

Farrer

Expires 8 September 2022

[Page 2]

Separate modules are defined for each element. Additionally, a 'common' module contains typedefs and groupings used by all of the element modules. [Appendix A](#) provides XML examples for each of the element modules and shows their interaction.

The relay and client modules provide configuration which is applicable to devices' interfaces. This is done by importing the ietf-interfaces module [[RFC8343](#)] and using interface-refs to the relevant interface(s).

It is worth noting that as DHCPv6 is itself a client configuration protocol, it is not the intention of this document to provide a replacement for the allocation of DHCPv6 assigned addressing and parameters by using NETCONF/YANG. The DHCPv6 client module is intended for the configuration and monitoring of the DHCPv6 client function and does not replace DHCPv6 address and parameter configuration.

The YANG modules in this document adopt the Network Management Datastore Architecture (NMDA) [[RFC8342](#)].

[1.1.](#) Scope

[[RFC8415](#)] describes the current version of the DHCPv6 base protocol specification. A large number of additional specifications have also been published, extending DHCPv6 element functionality and adding new options. The YANG modules contained in this document do not attempt to capture all of these extensions and additions, rather to model the DHCPv6 functions and options covered in [[RFC8415](#)]. A focus has also been given on the extensibility of the modules so that they are easy to augment to add additional functionality as required by a particular implementation or deployment scenario.

[1.2.](#) Extensibility of the DHCPv6 Server YANG Module

The modules in this document only attempt to model DHCPv6-specific behavior and do not cover the configuration and management of functionality relevant for specific server implementations. The level of variance between implementations is too great to attempt to standardize them in a way that is useful without being restrictive.

However, it is recognized that implementation-specific configuration and management is also an essential part of DHCP deployment and operations. To resolve this, [Appendix C](#) contains an example YANG module for the configuration of implementation-specific functions, illustrating how this functionality can be augmented into the main 'ietf-dhcpv6-server.yang' module.

[Page 3]

In DHCPv6, the concept of 'class selection' for messages received by the server is common. This is the identification and classification of messages based on a number of parameters so that the correct provisioning information can be supplied. For example, allocating a prefix from the correct pool, or supplying a set of options relevant for a specific vendor's client implementation. During the development of this document, implementations were researched and the findings were that while this function is common to all, the method for configuring and implementing this function differs greatly. Therefore, configuration of the class selection function has been omitted from the DHCPv6 server module to allow implementors to define their own suitable YANG modules. [Appendix D](#) provides an example of this, to demonstrate how this can be integrated with the main 'ietf-dhcpv6-server.yang' module.

[1.2.1. DHCPv6 Option Definitions](#)

A large number of DHCPv6 options have been created in addition to those defined in [\[RFC8415\]](#). As implementations differ widely as to which DHCPv6 options they support, the following approach has been taken to defining options: Only the DHCPv6 options defined in [\[RFC8415\]](#) are included in this document.

Of these, only the options that require operator configuration are modeled. For example, OPTION_IA_NA (3) is created by the DHCP server when requested by the client. The contents of the fields in the option are based on a number of input configuration parameters which the server will apply when it receives the request (e.g., the T1/T2 timers that are relevant for the pool of addresses). As a result, there are no fields that are directly configurable for the option, so it is not modeled.

The following table shows the DHCPv6 options that are modeled, the element(s) they are modeled for, and the relevant YANG module name:

Name	Server	Relay	Client	Module Name
OPTION_ORO (6) Option			X	ietf-dhcpv6-client.yang
Request Option				
OPTION_PREFERENCE (7)	X			ietf-dhcpv6-server.yang
Preference Option				
OPTION_AUTH (11) Authentication Option	X	X		ietf-dhcpv6-common.yang
OPTION_UNICAST (12)	X			ietf-dhcpv6-server.yang

[Page 5]

Further options definitions can be added using additional YANG modules via augmentation of the relevant element modules from this document. [Appendix B](#) contains an example module showing how the DHCPv6 option definitions can be extended in this manner. Some guidance on how to write YANG modules for additional DHCPv6 options is also provided.

[1.3. Terminology](#)

The reader should be familiar with the YANG data modeling language defined in [[RFC7950](#)].

The YANG modules in this document adopt the Network Management Datastore Architecture (NMDA) [[RFC8342](#)]. The meanings of the symbols used in tree diagrams are defined in [[RFC8340](#)].

The reader should be familiar with DHCPv6 relevant terminology as defined in [[RFC8415](#)] and other relevant documents.

[2. Requirements Language](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[3. DHCPv6 Tree Diagrams](#)

[3.1. DHCPv6 Server Tree Diagram](#)

The tree diagram in Figure 1 provides an overview of the DHCPv6 server module. The tree also includes the common functions module defined in [Section 4.1](#).

Figure 1: DHCPv6 Server Data Module Structure

Descriptions of important nodes:

- * enabled: Enables/disables the function of the DHCPv6 server.
- * dhcpv6-server: This container holds the server's DHCPv6 specific configuration.
- * server-duid: Each server must have a DUID (DHCP Unique Identifier) to identify itself to clients. A DUID consists of a two-octet type field and an arbitrary length (of no more than 128-octets) content field. Currently there are four DUID types defined in [RFC8415] and [RFC6355]. The DUID may be configured using the format for one of these types, or using the 'unstructured' format. The DUID type definitions are imported from the 'ietf-dhcpv6-common.yang' module. [IANA-HARDWARE-TYPES] and [IANA-PEN] are referenced for the relevant DUID types.
- * vendor-config: This container is provided as a location for additional implementation-specific YANG nodes for the configuration of the device to be augmented. See [Appendix C](#) for an example of such a module.

Farrer

Expires 8 September 2022

[Page 11]

- * option-sets: The server can be configured with multiple option-sets. These are groups of DHCPv6 options with common parameters which will be supplied to clients on request. The 'option-set-id' field is used to reference an option-set elsewhere in the server's configuration.
- * option-set: Holds configuration parameters for DHCPv6 options. The initial set of applicable option definitions are defined here and additional options that are also relevant to the relay and/or client are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.
- * class-selector: This is provided as a location for additional implementation specific YANG nodes for vendor specific class selector nodes to be augmented. See [Appendix D](#) for an example of this.
- * allocation-ranges: A hierarchical model is used for the allocation of addresses and prefixes. The top level 'allocation-ranges' container holds global configuration parameters. Under this, the 'allocation-range' list is used for specifying IPv6 prefixes and additional, prefix specific parameters.
- * address-pools: Used for IA_NA and IA_TA pool allocations with a container for defining host reservations. State information about active leases from each pool is also located here.
- * prefix-pools: Defines pools to be used for prefix delegation to clients. Static host reservations can also be configured. As prefix delegation is not supported by all DHCPv6 server implementations, it is enabled by a feature statement.

Information about RPCs

- * delete-address-lease: Allows the deletion of a lease for an individual IPv6 address from the server's lease database.
- * delete-prefix-lease: Allows the deletion of a lease for an individual IPv6 prefix from the server's lease database.

Information about notifications:

- * address/prefix-pool-utilization-threshold-exceeded: Raised when the number of leased addresses or prefixes in a pool exceeds the configured usage threshold.

Farrer

Expires 8 September 2022

[Page 12]

- * invalid-client-detected: Raised when the server detects an invalid client. A description of the error and message type that has generated the notification can be included.
- * decline-received: Raised when a DHCPv6 Decline message is received from a client.
- * non-success-code-sent: Raised when there is a status message for a failure.

[3.2. DHCPv6 Relay Tree Diagram](#)

The tree diagram in Figure 2 provides an overview of the DHCPv6 relay module. The tree also includes the common functions module defined in [Section 4.1](#).

The RPCs in the module are taken from requirements defined in [[RFC8987](#)].

```
module: ietf-dhcpv6-relay
  +-rw dhcpv6-relay
    +-rw enabled?          boolean
    +-rw relay-if* [if-name]
      |  +-rw if-name           if:interface-ref

```

Figure 2: DHCPv6 Relay Data Module Structure

Descriptions of important nodes:

- * enabled: Globally enables/disables all DHCPv6 relay functions.
- * dhcpv6-relay: This container holds the relay's DHCPv6-specific configuration.
- * relay-if: As a relay may have multiple client-facing interfaces, they are configured in a list. The if-name leaf is the key and is an interface-ref to the applicable interface defined by the 'ietf-interfaces' YANG module.
- * enabled: Enables/disables all DHCPv6 relay functions for the specific interface.
- * destination-addresses: Defines a list of IPv6 addresses that client messages will be relayed to. May include unicast or multicast addresses.
- * link-address: Configures the value that the relay will put into the link-address field of Relay-Forward messages.
- * prefix-delegation: As prefix delegation is not supported by all DHCPv6 relay implementations, it is enabled by this feature statement where required.

Farrer

Expires 8 September 2022

[Page 15]

- * pd-leases: Contains read-only nodes for holding information about active delegated prefix leases.
- * relay-options: Holds configuration parameters for DHCPv6 options which can be sent by the relay. The initial set of applicable option definitions are defined here and additional options that are also relevant to the server and/or client are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.

Information about RPCs

- * clear-prefix-entry: Allows the removal of a delegated lease entry from the relay.
- * clear-client-prefixes: Allows the removal of all of the delegated lease entries for a single client (referenced by client DUID) from the relay.
- * clear-interface-prefixes: Allows the removal of all of the delegated lease entries from an interface on the relay.

Information about notifications:

- * topology-change: Raised when the topology of the relay agent is changed, e.g., a client facing interface is reconfigured.

[3.3. DHCPv6 Client Tree Diagram](#)

The tree diagram in Figure 3 provides an overview of the DHCPv6 client module. The tree also includes the common functions module defined in [Section 4.1](#).

```

Figure 3: DHCPv6 Client Data Module Structure

Descriptions of important nodes:

- * enabled: Globally enables/disables all DHCPv6 client functions.
- * dhcpv6-client: This container holds the client's DHCPv6 specific configuration.
- * client-if: As a client may have multiple interfaces requesting configuration over DHCP, they are configured in a list. The if-name leaf is the key and is an interface-ref to the applicable interface defined by the 'ietf-interfaces' YANG module.
- * enabled: Enables/disables all DHCPv6 client function for the specific interface.

Farrer

Expires 8 September 2022

[Page 19]

- * client-duid/interface-duid: The DUID (DHCP Unique Identifier) is used to identify the client to servers and relays. A DUID consists of a two-octet type field and an arbitrary length (1-128 octets) content field. Currently there are four DUID types defined in [[RFC8415](#)] and [[RFC6355](#)]. The DUID may be configured using the format for one of these types, or using the 'unstructured' format. The DUID type definitions are imported from the 'ietf-dhcpv6-common.yang' module. [[IANA-HARDWARE-TYPES](#)] and [[IANA-PEN](#)] are referenced for the relevant DUID types. A DUID only needs to be configured if the client is requesting addresses and/or prefixes from the server. Presence of the 'client-duid' or 'interface-duid' leaves is conditional on at least one of the 'non-temp-addr', 'temp-addr', or 'prefix-delegation' features being enabled. Additionally, if the 'anon-profile' [[RFC7844](#)] feature is enabled, a unique DUID can be configured per DHCP enabled interface using the 'interface-duid' leaf, otherwise there is a global 'client-duid' leaf.
- * client-configured-options: Holds configuration parameters for DHCPv6 options which can be sent by the client. The initial set of applicable option definitions are defined here and additional options that are also relevant to the relay and/or server are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.
- * ia-na, ia-ta, ia-pd: Contains configuration nodes relevant for requesting one or more of each of the lease types. Read-only nodes related to the active leases for each type are also located here. As these lease types may not be supported by all DHCPv6 client implementations, they are enabled via individual feature statements. Stateless DHCP ([\[RFC8415\] Section 6.1](#)) is configured when all address and prefix features are disabled.

Information about notifications:

- * invalid-ia-detected: Raised when the identity association of the client can be proved to be invalid. Possible conditions include: duplicated address, illegal address, etc.
- * retransmission-failed: Raised when the retransmission mechanism defined in [[RFC8415](#)] has failed.

        "DUID type 3, based on Link-Layer Address (DUID-LL).
        Constructed with a 2-octet hardware type assigned
        by IANA, and a link-layer address. The address is encoded
        without separator characters. For example:
        +-----+-----+-----+
        | 0003 | 0006 | 00005E005300 |
        +-----+-----+-----+
        This example includes the 2-octet DUID type of 3 (0x03), the
        hardware type is 0x06 (IEEE Hardware Types), and the
        link-layer address is 0x5E005300 (EUI-48 address
        00-00-5E-00-53-00)";
    reference "RFC 8415: Dynamic Host Configuration Protocol for
        IPv6 (DHCPv6), Section 11.4
        IANA 'Hardware Types' registry.
        <https://www.iana.org/assignments/arp-parameters>";
}

5. Security Considerations

The YANG modules defined in this document are designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The Network Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

All data nodes defined in the YANG modules which can be created, modified, and deleted (i.e., config true, which is the default) are considered sensitive. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

Farrer

Expires 8 September 2022

[Page 75]

The RPCs for deleting/clearing active address and prefix entries in the server and relay modules are particularly sensitive. These RPCs use 'nacm:default-deny-all'.

An attacker with read/write access to the DHCPv6 server can undertake various attacks, such as:

- * Denial of service attacks, such as disabling the DHCP server service, or removing address/prefix pool configuration.
- * Various attacks based on re-configuring the contents of DHCPv6 options, leading to several types of security or privacy threats. These options could redirect clients to services under an attacker's control. For example, changing the address of a DNS server supplied in a DHCP option to point to a rogue server.

An attacker sending DHCPv6 messages which cause the server to generate 'invalid-client-detected' and 'decline-received' notifications could be used as a DoS attack. Such an attack could be mitigated by the NETCONF client unsubscribing from the affected notifications.

An attacker with read/write access the DHCPv6 relay can undertake various attacks, such as:

- * Denial of service attacks, based on disabling the DHCP relay function, or modifying the relay's "destination-address" to a non-existent address.
- * Modifying the relay's "destination-address" to send messages to a rogue DHCPv6 server.
- * Deleting information about a client's delegated prefix, causing a denial of service attack as traffic will no longer be routed to the client.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. Therefore, it is important to control read access (e.g., via get, get-config, or notification) to these data nodes. These subtrees and data nodes can be misused to track the activity or fingerprint the device type of the host:

- * Information the server holds about clients with active leases: (dhc6-srv/allocation-ranges/allocation-range/address-pools/address-pool/active-leases)

Farrer

Expires 8 September 2022

[Page 76]

- * Information the relay holds about clients with active leases:
(dhc6-rly/relay-if/prefix-delegation/)

Information about a server's configured address and prefix pools may be used by an attacker for network reconnaissance [[RFC7707](#)]. The following subtrees and data nodes could be used for this purpose:

- * Information about client address allocation ranges: (dhc6-srv/ allocation-ranges/allocation-range/address-pools/ address-pool/ pool-prefix)
- * Information about client prefix allocation ranges: (dhc6-srv/ allocation-ranges/allocation-range/prefix-pools/ prefix-pool/pool-prefix)

[[RFC7844](#)] describes anonymity profiles for DHCP clients. These can be used to prevent client tracking on a visited network. Support for this can be enabled by implementing the 'anon-profile' feature in the client module.

[[RFC7824](#)] covers privacy considerations for DHCPv6 and is applicable here.

Security considerations related to DHCPv6 are discussed in [[RFC8415](#)].

Security considerations given in [[RFC7950](#)] are also applicable here.

6. IANA Considerations

This document registers four URIs and four YANG modules.

6.1. URI Registration

This document requests IANA to register the following four URIs in the "IETF XML Registry" [[RFC3688](#)]:

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-server
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-relay
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-client
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

Farrer

Expires 8 September 2022

[Page 77]

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-common
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.

6.2. YANG Module Name Registration

This document registers the following four YANG modules in the "YANG Module Names" registry [[RFC6020](#)].

name:	ietf-dhcpv6-server
namespace:	urn:ietf:params:xml:ns:yang:ietf-dhcpv6-server
prefix:	dhc6-srv
reference:	RFC XXXX YANG Data Model for DHCPv6 Configuration
name:	ietf-dhcpv6-relay
namespace:	urn:ietf:params:xml:ns:yang:ietf-dhcpv6-relay
prefix:	dhc6-rly
reference:	RFC XXXX YANG Data Model for DHCPv6 Configuration
name:	ietf-dhcpv6-client
namespace:	urn:ietf:params:xml:ns:yang:ietf-dhcpv6-client
prefix:	dhc6-clnt
reference:	RFC XXXX YANG Data Model for DHCPv6 Configuration
name:	ietf-dhcpv6-common
namespace:	urn:ietf:params:xml:ns:yang:ietf-dhcpv6-common
prefix:	dhc6
reference:	RFC XXXX YANG Data Model for DHCPv6 Configuration

7. Acknowledgments

The authors would like to thank Qi Sun, Lishan Li, Hao Wang, Tomek Mrugalski, Marcin Siodelski, Bernie Volz, Ted Lemon, Bing Liu, Tom Petch, Acee Lindem, and Benjamin Kaduk for their valuable comments and contributions to this work.

8. Contributors

Appendix A. Data Tree Examples

This section contains XML examples of data trees for the different DHCPv6 elements.

A.1. DHCPv6 Server Configuration Examples

The following example shows a basic configuration for a server. The configuration defines:

- * Enabling the DHCP server function.
- * The server's DUID.
- * An option set (id=1) with configuration for the Solicit Max Retry Timeout (SOL_MAX_RT (82)) option.
- * A single network range (2001:db8::/32).
- * A single address pool, with start and end addresses, relevant lease timers and an option-set-id of "1" referencing the option set configured above.

        <pool-prefix>2001:db8:1::/48</pool-prefix>
        <client-prefix-length>56</client-prefix-length>
        <max-pd-space-utilization>80</max-pd-space-utilization>
      </prefix-pool>
    </prefix-pools>
  </allocation-range>
</allocation-ranges>
```

Figure 6: Server Prefix Delegation Configuration Example XML Snippet

The next example configuration snippet shows a set of options that may be returned to clients, depending on the contents of a received DHCP request message. The option set ID is '1', which will be referenced by other places in the configuration (e.g., address pool configuration) as the available options for clients that request them.

The example shows how the option definitions can be extended via augmentation. In this case, "OPTION_SIP_SERVER_D (21) SIP Servers Domain-Name List" from the example module in [Appendix B](#) has been augmented to the server's option set.

Figure 7: Server Option Set Configuration Example XML Snippet

A.2. DHCPv6 Relay Configuration Example

The following example shows a basic configuration for a single DHCP relay interface and its interaction with the `ietf-interfaces` module. The configuration shows two XML documents, one for `ietf-interfaces` and a second for `ietf-dhcpv6-relay`, defining:

- * Configuring an interface using the `ietf-interfaces` module that the relay configuration will be applied to.
- * Enabling the DHCP relay function globally and for the relevant interface.

Farrer

Expires 8 September 2022

[Page 86]

- * Referencing the interface that the relay configuration is relevant for via an `interface-ref` to the `ietf-interfaces` module.
- * Defining two destination addresses that incoming DHCP messages will be relayed to.
- * Configures the link-address value that will be sent in the relay-forward message.
- * Configuring a value for the Interface ID Option (`OPTION_INTERFACE_ID (18)`), which will be included in the relay-forward message.

```

<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
  xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>
    <type>ianaift:ethernetCsmacd</type>
    <description>DHCPv6 Relay Interface</description>
    <enabled>true</enabled>
  </interface>
</interfaces>

<dhcpv6-relay xmlns="urn:ietf:params:xml:ns:yang:ietf-dhcpv6-relay">
  <enabled>true</enabled>
  <relay-if>
    <if-name>eth0</if-name>
    <enabled>true</enabled>
    <destination-address>2001:db8:2::1</destination-address>
    <destination-address>2001:db8:2::2</destination-address>
    <link-address>2001:db8:3::1</link-address>
    <relay-options>
      <interface-id-option>
        <interface-id>EXAMPLEINTERFACEID01</interface-id>
      </interface-id-option>
    </relay-options>
  </relay-if>
</dhcpv6-relay>
```

Figure 8: Basic Relay Configuration Example XML

A.3. DHCPv6 Client Configuration Example

The following example shows a basic configuration for a DHCP client and its interaction with the `ietf-interfaces` module. The configuration shows two XML documents, one for `ietf-interfaces` and a second for `ietf-dhcpv6-client` defining:

Farrer

Expires 8 September 2022

[Page 87]

- * Configuring an interface using the ietf-interfaces module that the client configuration will be applied to.
- * Enabling the DHCP client function globally and for the relevant interface.
- * References the interface that the client configuration is relevant for via an interface-ref to the ietf-interfaces module.
- * Sets the DUID for the DHCPv6 enabled interface.
- * Configures a list of option codes that will be requested by the client in its Option Request Option (OPTION_ORO (5)).
- * Configures a single instance of the Vendor-specific Information Option (OPTION_VENDOR_OPTS (17)) with a single sub-option data item.
- * Requests a non-temporary IPv6 address (IA_NA) with an identity association interface identifier of 1.
- * Requests an IPv6 delegated prefix address (IA_PD) with an identity association interface identifier of 2.

Appendix B. Example of Augmenting Additional DHCPv6 Option Definitions

The following section provides a example of how the DHCPv6 option definitions can be extended to include additional options. It is expected that additional specification documents will be published for this in the future.

The example defines YANG models for OPTION_SIP_SERVER_D (21) and OPTION_SIP_SERVER_D (22) defined in [[RFC3319](#)]. Example XML configuration, showing the interworking with other modules is provided in Figure 7.

The module is constructed as follows:

- * The module is named using a meaningful, shortened version of the document name in which the DHCP option format is specified.
- * A separate grouping is used to define each option.
- * The name of the option is taken from the registered IANA name for the option, with an '-option' suffix added.
- * The description field is taken from the relevant option code name and number.
- * The reference section is the number and name of the RFC in which the DHCPv6 option is defined.
- * The remaining fields match the fields in the DHCP option. They are in the same order as defined in the DHCP option. Where-ever possible, the format that is defined for the DHCP field should be matched by the relevant YANG type.
- * Fields which can have multiple entries or instances are defined using list or leaf-list nodes.

Below the groupings for option definitions, augment statements are used to add the option definitions for use in the relevant DHCP element's module (server, relay and/or client).

```
module example-dhcpv6-opt-sip-serv {  
    yang-version 1.1;  
    namespace "https://example.com/ns/" +  
        "example-dhcpv6-opt-sip-serv";  
    prefix "sip-srv";  
  
    import ietf-inet-types {  
        prefix inet;

    }
}
}

/*
 * Augmentations
 */
augment "/dhc6-srv:dhcpv6-server/dhc6-srv:option-sets/" +
    "dhc6-srv:option-set" {
    description
        "Augment the option definition groupings to the server
         module.";
    uses sip-server-domain-name-list-option-group;
    uses sip-server-address-list-option-group;
}
}

```

The correct location to augment the new option definition(s) will vary according to the specific rules defined for the use of that specific option. For example, for options which will be augmented into the `ietf-dhcpv6-server` module, in many cases, these will be augmented to:

```
'/dhc6-srv:dhc6-srv/dhc6-srv:option-sets/dhc6-srv:option-set'
```

So that they can be defined within option sets. However, there are some options which are only applicable for specific deployment scenarios and in these cases it may be more logical to augment the option group to a location relevant for the option.

One example for this could be `OPTION_PD_EXCLUDE` (67). This option is only relevant in combination with a delegated prefix which contains a specific prefix. In this case, the following location for the augmentation may be more suitable:

```
'/dhc6-srv:dhc6-srv/dhc6-srv:allocation-ranges/dhc6-srv:allocation-
range/dhc6-srv:prefix-pools/dhc6-srv:prefix-pool"
```

[Appendix C. Example Vendor Specific Server Configuration Module](#)

This section shows how to extend the server YANG module defined in this document with vendor specific configuration nodes, e.g., configuring access to a lease storage database.

Farrer

Expires 8 September 2022

[Page 93]

The example module defines additional server attributes such as name and description. Storage for leases is configured using a lease-storage container. It allows storing leases in one of three options: memory (memfile), MySQL and PostgreSQL. For each case, the necessary configuration parameters are provided.

For simplicity, this example module assumes that the DHCPv6 server is colocated with the MySQL or PostgreSQL database server and can serve traffic securely on the localhost without additional cryptographic protection. In a production deployment, these functions would likely not be colocated and thus use TLS to secure the database connection between the DHCPv6 server and database server. A YANG module for configuring TLS is defined in [[I-D.ietf-netconf-tls-client-server](#)].

At the end there is an augment statement which adds the vendor specific configuration defined in "dhcpv6-server-config:config" under the "/dhcpv6-server:config/dhcpv6-server:vendor-config" mount point.

```
module example-dhcpv6-server-conf {
    yang-version 1.1;
    namespace "https://example.com/ns/" +
        "example-dhcpv6-server-conf";
    prefix "dhc6-srv-conf";

    import ietf-inet-types {
        prefix inet;
    }

    import ietf-interfaces {
        prefix if;
    }

    import ietf-dhcpv6-server {
        prefix dhc6-srv;
    }

[Appendix D.](#) Example definition of class-selector configuration

The module "ietf-example-dhcpv6-class-selector" provides an example of how vendor-specific class selection configuration can be modeled and integrated with the "ietf-dhcpv6-server" module defined in this document.

The example module defines "client-class-names" with associated matching rules. A client can be classified based on "client-id", "interface-id" (ingress interface of the client's messages), packet's source or destination address, relay link address, relay link interface-id and more. Actually, there are endless methods for classifying clients. So this standard does not try to provide full specification for class selection, it only shows an example of how it could be defined.

At the end of the example augment statements are used to add the defined class selector rules into the overall DHCPv6 addressing hierarchy. This is done in two main parts:

- * The augmented class-selector configuration in the main DHCPv6 Server configuration.

Farrer

Expires 8 September 2022

[Page 99]

- * client-class leafrefs augmented to "allocation-range", "address-pool" and "pd-pool", pointing to the "client-class-name" that is required.

The mechanism is as follows: class is associated to client based on rules and then client is allowed to get address(es)/prefix(es) from a given allocation-range/pool if the class name matches.

```
module example-dhcpv6-class-select {
    yang-version 1.1;
    namespace "https://example.com/ns/" +
        "example-dhcpv6-class-select";
