KDC Server Address Sub-option
<[draft-ietf-dhc-suboptions-kdc-serveraddress-01.txt](#)>

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

This document defines a new sub-option for the CableLabs Client Configuration (CCC) DHCP option code for conveying the network addresses of Key Distribution Center (KDC) servers.

1. Introduction

The need for a CCC DHCP Option code is described in [[1](#)]. The CCC DHCP option code will be used to address specific needs of CableLabs client devices during their configuration processes. This document proposes a sub-option for the CCC DHCP option.

Configuration of a class of CableLabs client devices described in [2] requires a DHCP sub-option to provide the client with the network address of a KDC server in the cable operator's data network. The class of devices assumed in [2] is unlike the class of devices considered in [1], which perform a DNS lookup of the Kerberos Realm name to find the KDC server network address.

This document proposes a sub-option of the CCC DHCP option code for use with CableLabs client devices. The proposed sub-option encodes an identifier for the network address of each of one or more Key Distribution Center servers with which the CableLabs client device exchanges security information.

CableLabs plans to assign sub-option code ranges for the CCC option according to CableLabs projects. The range (51 - 100) is assigned to the CableHome project. Use of the initial value of this range is specified in [2].

The key words "MUST", "MUST NOT", "SHOULD", "SHOULD NOT" and "MAY" in this document are to be interpreted as described in [RFC 2119](#) [3].

2. Key Distribution Center IP Address Sub-option

The CableHome 1.0 specification [2] specifies the Key Distribution Center network address encoding as a sub-option of the CCC DHCP Option code. This field is used to inform the client device of the network address of one or more Key Distribution Center servers.

The encoding of the KDC Server Address sub-option will adhere to the format of an IPv4 address using the default port. The minimum length for this option is 4 octets, and the length MUST always be a multiple of 4. If multiple KDC Servers are listed, they MUST be listed in decreasing order of priority. The format of the KDC Server Address sub-option of the CCC option code is as shown below:

SubOpt	Len	Address 1				Address 2		
51	n	a1	a2	a3	a4	a1	a2	...

3. Security Considerations

This document relies upon the DHCP protocol [4] for authentication and security, i.e., it does not provide security in excess of what DHCP is (or will be) providing. It does not expose any security threats beyond what is currently exposed by other DHCP options.

4. IANA Considerations

The KDC Server Address sub-option described in this document is intended to be a sub-option of the CableLabs Client Configuration (CCC) option described in [1]. IANA will be requested to register sub-option code 51 of the CCC option to the KDC Server Address sub-option.
