## Vendor-Identifying Vendor Options for DHCPv4 draft-ietf-dhc-vendor-00.txt

Status of this Memo

This document is an Internet-Draft and is subject to all provisions of Section 10 of RFC2026.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet- Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/1id-abstracts.html

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html

### Abstract

The DHCP options for Vendor Class and Vendor-Specific Information can be ambiguous when a DHCP client represents multiple vendors. This document defines two new options, modeled on the IPv6 options for vendor class and vendor-specific information, which contain Enterprise Numbers to remove ambiguity.

### Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in <a href="RFC-2119">RFC-2119</a> [1].

### 1. Introduction

The DHCP protocol for IPv4 defines options to allow a client to indicate its vendor type (option 60), and to allow the DHCP client and server to exchange vendor-specific information (option 43) [2]. While there is no prohibition against passing multiple copies of these options in a single packet, doing so would introduce ambiguity of interpretation, particularly if conveying vendor-specific information for multiple vendors. The vendor identified by option 60 defines the interpretation of option 43, which itself carries no vendor identifier.

There are circumstances where an implementation may need to support multiple, independently defined forms of vendor-specific information. For example, implementations that must conform to an industry-standard use of DHCPv4, to allow interoperability in a particular technology space, may be required to support the vendor-specific options of that industry group. But the same implementation may also require support for vendor-specific options defined by the manufacturer. In particular, this is an issue for vendors of devices supporting CableLabs standards, such as DOCSIS, CableHome, and PacketCable, since those standards define an industry-specific use for options 60 and 43.

This document defines two new options, modeled on the IPv6 options for vendor class and vendor-specific information [3], which contain Enterprise Numbers to remove ambiguity. If desired, these new options can be used in addition to the current vendor class and vendor information options, whose definition is unaffected by this document.

## 2. Vendor-Identifying Vendor Class Option

A DHCP client may use this option to unambiguously identify the vendor that manufactured the hardware on which the client is running, or an industry consortium to which the vendor belongs. The information contained in the data area of this option is contained in one or more opaque fields that identify details of the hardware configuration.

[Page 2]

The format of the V-I Vendor Class option is:

	0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1		
•	R_CLASS   option-len		
enterprise-number   +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+			
	vendor-class-data .		
+-+-+-+-+-+-+-+-+	-+		
option-code	OPTION_V-I VENDOR_CLASS (to be assigned by IANA)		
option-len	4 + length of vendor class data field		
enterprise-number	The vendor's registered Enterprise Number as registered with IANA $\left[\frac{4}{}\right].$		
vendor-class-data	The hardware configuration of the host on which the client is running.		

Each instance of this option contains information corresponding to a single Enterprise Number. Multiple instances of this option may be present, and each is treated independently.

The vendor-class-data is composed of a series of separate items, each of which describes some characteristic of the client's hardware configuration or capabilities. Examples of vendor-class-data instances might include the version of the operating system the client is running or the amount of memory installed on the client.

Each instance of the vendor-class-data is formatted as follows:

The vendor-class-len is two octets long and specifies the length of the opaque vendor class data in network byte order.

#### **Vendor-Identifying Vendor-Specific Information Option** <u>3</u>.

DHCP Clients and servers may use this option to exchange vendorspecific information.

Littlefield

Expires March 2004

[Page 3]

The format of the V-I Vendor-specific Information option is:

+-+-+-+-+-+-+-+-+-+-+-+-+	0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
	option-data .
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-++	-+
option-code	OPTION_V-I VENDOR_OPTS (to be assigned by IANA)
option-len	4 + length of option-data field
enterprise-number	The vendor's registered Enterprise Number as registered with IANA $\left[ \begin{smallmatrix} 4 \end{smallmatrix} \right]$ .
option-data	Encapsulated vendor-specific options, described below.

The definition of the information carried in this option is vendor specific. The vendor is indicated in the enterprise-number field. Each instance of this option contains information corresponding to a single Enterprise Number. Multiple instances of this option may be present, and each is treated independently.

Use of vendor-specific information allows enhanced operation, utilizing additional features in a vendor's DHCP implementation. Servers not equipped to interpret the vendor-specific information sent by a client MUST ignore it. Clients that do not receive desired vendor-specific information SHOULD make an attempt to operate without it.

The encapsulated vendor-specific options field MUST be encoded as a sequence of code/length/value fields of identical format to the DHCP options field. The option codes are defined by the vendor identified in the enterprise-number field and are not managed by IANA. Option codes 0 and 255 have no pre-defined interpretation or format. Each of the encapsulated options is formatted as follows:

0 1 2	3 4 5 6 7 8 9 0 1 2	3 4 5 6 7 8	9 0 1 2 3 4 5 6 7 8 9	0 1
+-+-+-	+-+-+-+-	+-+-+-+-+-+	+-+-+-+-+-+-+-+-+-+	-+-+
1	opt-code	1	option-len	
+-+-+-	+-+-+-+-+-	+-+-+-+-+-+	+-+-+-+-+-+-+-+-+-+-+	-+-+

	option-data	
+-+-+-+-+-	-+	+-+-+-+-+-+-+
Littlefield	Expires March 2004	[Page 4]

The code for the encapsulated option opt-code

option-len An unsigned integer giving the length of the

option-data field in this encapsulated option

in octets.

option-data The data area for the encapsulated option

Multiple instances of the Vendor-specific Information option may appear in a DHCP message. Each instance of the option is interpreted according to the option codes defined by the vendor identified by the Enterprise Number in that option.

#### 4. **IANA Considerations**

The values for the V-I VENDOR CLASS and V-I VENDOR OPTS option codes must be assigned from the numbering space defined for public DHCP Options in <u>RFC 2939</u> [5].

### 5. Security Considerations

This document in and by itself provides no security, nor does it impact existing security. DHCP provides an authentication and message integrity mechanism, as described in RFC 3118 [6], which may be used if authenticity is required for data carried by the options defined in this document.
