

**RFC 3597 Interoperability Report**  
**draft-ietf-dnsext-interop3597-02.txt**

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on November 20, 2005.

## **1. Introduction**

This memo documents the result from the [RFC 3597](#) (Handling of Unknown DNS Resource Record Types) interoperability testing. The test was performed during June and July 2004 by request of the IETF DNS Extensions Working Group.

## **2. Implementations**

The following is a list, in alphabetic order, of implementations tested for compliance with [RFC 3597](#):

- DNSJava 1.6.4
- ISC BIND 8.4.5
- ISC BIND 9.3.0
- NSD 2.1.1
- Net::DNS 0.47 patchlevel 1
- Nominum ANS 2.2.1.0.d

These implementations covers the following functions (number of implementations tested for each function in paranthesis):

- Authoritative Name Servers (4)
- Full Recursive Resolver (2)
- Stub Resolver (4)
- DNSSEC Zone Signers (2)

All listed implementations are genetically different.

## **3. Tests**

The following tests was been performed to validate compliance with [RFC 3597 section 3](#) ("Transparency"), 4 ("Domain Name Compression") and 5 ("Text Representation").

### **3.1 Authoritative Primary Name Server**

The test zone data (Appendix A) was loaded into the name server implementation and the server was queried for the loaded information.

### **3.2 Authoritative Secondary Name Server**

The test zone data (Appendix A) was transferred using AXFR from another name server implementation and the server was queried for the transferred information.

### **[3.3](#) Full Recursive Resolver**

A recursive resolver was queried for resource records from a domain with the test zone data (Appendix A).

### **[3.4](#) Stub Resolver**

A stub resolver was used to query resource records from a domain with the test zone data (Appendix A).

### **[3.5](#) DNSSEC Signer**

A DNSSEC signer was used to sign a zone with test zone data (Appendix A).

## **[4.](#) Problems found**

Two implementations had problems with text presentation of zero length RDATA.

One implementation had problems with text presentation of RR type code and classes  $\geq 4096$ .

Bug reports were filed for problems found.

## **[5.](#) Summary**

Unknown type codes works in the tested authoritative servers, recursive resolvers and stub clients.

No changes are needed to advance [RFC 3597](#) to draft standard.

## **[6.](#) Normative References**
