The ENUM Branch Location Record
draft-ietf-enum-branch-location-record-00

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on February 3, 2007.

Abstract

This documents defines the ENUM Branch Location record (EBL) which is used to indicate where the ENUM tree for special ENUM application is located. The primary application for the EBL record is to provide a temporary solution for the infrastructure ENUM tree location.

Table of Contents

1.	Introduction	3
2.	ENUM Tree Referrals	3
3.	The EBL Resource Record	4
3.1	The EBL RDATA Format	4
3.2	The EBL Presentation Format	4
4.	Examples	4
5.	Security Considerations	5
6.	IANA Considerations	5
7.	Acknowledgements	5

[Page 2]

1. Introduction

ENUM as defined in [RFC3761](#) [1] (User-ENUM) is not well suited for the purpose of interconnection by carriers, as can be seen by the use of various private tree arrangements based on ENUM mechanisms.

Using the same E.164 number to domain mapping technique for other application under a different apex (instead of e164.arpa) is straightforward on the technical side. Establishing the international agreements necessary to delegate the country-code level subdomains under the new apex is non-trivial and time-consuming. This process is under way [5].

ENUM Branch Location records as defined by this document can be used to quickly introduce new ENUM trees on a per-country opt-in basis by storing the location and layout of new trees in the User-ENUM tree.

While Infrastructure ENUM is the motivation for the introduction of the EBL record, its use is not limited to Infrastructure ENUM.

More information and motivation can be found in [draft-ietf-enum-infrastructure-enum-reqs](#) [3] and [draft-haberler-carrier-enum](#) [4].

2. ENUM Tree Referrals

To allow maximum flexibility, the following parameters will be used in ENUM tree referrals.

Application

indicating to what kind of application this EBL applies to. In the case of Infrastructure ENUM, this will be "infrastructure".

Separator

indicating what label should be inserted into the ENUM domain to branch off to the application-specific tree. This can be an empty (zero-length) string which means that no label will be inserted.

Position

indicating at what place this label should be inserted into the ENUM domain to branch off to the application-specific tree. A value of 0 means to the right of all digits.

[Page 3]

Apex

indicating what domain should replace "e164.arpa" as the apex for this application.

The "application" acts as the selector and is stored as the label in the DNS. The other three parameters make up the content of the EBL.

3. The EBL Resource Record

The EBL will reside within the country-code level in the User-ENUM tree under e164.arpa.

The RR type code for the EBL RR is /IANA-ACTION/.

3.1 The EBL RDATA Format

The RDATA for a EBL RR consists of a position number, separator string and an apex domain. <character-string> and <domain-name> refer to the definitions of [RFC 1035](#) [2].

```

0  1  2  3  4  5  6  7
+---+---+---+---+---+---+---+
|           POSITION           |
+---+---+---+---+---+---+---+
/           SEPARATOR        /
+---+---+---+---+---+---+---+
/           APEX             /
+---+---+---+---+---+---+---+
```

where POSITION is a single byte, SEPARATOR is a <character-string> and APEX is a <domain-name>. Name-compression is not to be used for the APEX field.

3.2 The EBL Presentation Format

The master file format follows the standard rules in [RFC 1035](#). POSITION is represented as decimal integer. SEPARATOR is a quoted string, APEX is a domain name and thus does not require quoting.

4. Examples

```

infrastructure.3.4.e164.arpa.  IN EBL 2 "i" e164.arpa.
infrastructure.1.e164.arpa.   IN EBL 4 "i" example.com.
infrastructure.9.4.e164.arpa. IN EBL 0 "" ie164.arpa.
```

These records indicate how the transformation from E.164 number to

[Page 4]

ENUM domains for the application "infrastructure" should be done for numbers in country code +43, +1, and +49. This leads to the following mappings:

+43 15056416	6.1.4.6.5.0.5.1.i.3.4.e164.arpa
+1 5551234567	7.6.5.4.3.2.1.i.5.5.5.1.example.com
+49 891234567	7.6.5.4.3.2.1.9.8.9.4.ie164.arpa

5. Security Considerations

EBLs are used to direct the ENUM resolvers to other places in the DNS for certain applications. As these EBLs are stored in the User-ENUM tree, these applications therefore depend on the security of the User-ENUM tree.

6. IANA Considerations

This documents allocates the Resource Records Type field for the EBL record.

7. Acknowledgements

The author would like to thank Michael Haberler, Richard Stastny, Klaus Nieminen, Richard Shockey, and Karsten Fleischhauer for their contributions.
