Definitions of Managed Objects for IEEE 802.3 Medium Attachment Units (MAUs)
draft-ietf-hubmib-rfc3636bis-03.txt

Status of this Memo

Copyright Notice

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines objects for managing IEEE 802.3 Medium Attachment Units (MAUs). This memo obsoletes RFC 3636. It amends that specification by moving MAU type OBJECT-IDENTITY definitions and relevant textual conventions into a separate Internet Assigned Number Authority (IANA) maintained MIB module. In addition, management information is added to enable support for Ethernet in the First Mile

(EFM) and 10GBASE-CX4 MAUs.

Table of Contents

1. Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines objects for managing IEEE 802.3 Medium Attachment Units (MAUs).

The previous version of this memo, RFC 3636 [RFC3636], defined a single MIB module. This memo splits the original MIB module into two, putting frequently updated object identities and textual conventions into a separate, IANA-maintained MIB module, in order to decrease re-issues of the basic MIB module.

The first version of the IANA-maintained MIB module also extends the list of managed objects to support Ethernet in the First Mile (EFM) and 10GBASE-CX4 interfaces.

Ethernet technology, as defined by the 802.3 Working Group of the IEEE, continues to evolve, with scalable increases in speed, new types of cabling and interfaces, and new features. This evolution may require changes in the managed objects in order to reflect this new functionality. This document, as with other documents issued by this working group, reflects a certain stage in the evolution of Ethernet technology. In the future, this document might be revised, or new documents might be issued by the Ethernet Interfaces and Hub MIB Working Group, in order to reflect the evolution of Ethernet technology.

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

3. Overview

Instances of these object types represent attributes of an IEEE 802.3 MAU. Several types of MAUs are defined in the IEEE 802.3 CSMA/CD standard [IEEE802.3]. These MAUs may be connected to IEEE 802.3 repeaters or to 802.3 (Ethernet-like) interfaces. For convenience this document refers to these devices as "repeater MAUs" and "interface MAUs."

The definitions presented here are based on Section 30.5, "Layer Management for 10 Mb/s, 100 Mb/s, 1000 Mb/s and 10 Gb/s Medium Attachment Units (MAUs)", Section 30.6, "Management for link Auto-Negotiation", and Annex 30A, "GDMO Specifications for 802.3 managed object classes" of IEEE Std. 802.3, 2002 edition [IEEE802.3], as amended by IEEE Std. 802.3ae-2002 [IEEE802.3ae], IEEE Std. 802.3ah-2004 [IEEE802.3ah] and IEEE Std. 802.3ak-2004 [IEEE802.3ak]. This specification is intended to provide for management of all types of Ethernet/802.3 MAUs.

3.1. Relationship to RFC 3636

The management definitions provided in this memo are intended to be a superset of those defined by RFC 3636 [RFC3636].

In order to decrease re-issues of this document due to the new MAU type, Media Available state, Auto Negotiation capability and/or Jack type introduction, all relevant object identities and textual conventions have been moved to a separate, IANA-maintained MIB module IANA-MAU-MIB, the first version of which is defined in this memo. Thus when a new MAU type, Media Available state, Auto Negotiation capability and/or Jack type is defined by the IEEE 802.3 working group, only the IANA-maintained module needs to be revised, leaving the basic MAU-MIB module defined in this memo unchanged.

In addition, the new definitions are added to the IANA-maintained MIB module, to support Ethernet in the First Mile (EFM) and 10GBASE-CX4 interfaces, defined in IEEE Std 802.3ah-2004 [IEEE802.3ah] and IEEE Std 802.3ak-2004 [IEEE802.3ak] respectively.

It should be noted that the changes made in this revision will not be entirely backward-compatible with MIB modules that currently import MAU type object identity descriptors from the MAU-MIB; such modules will need to be revised to import those DESCRIPTORS from the IANA-MAU-MIB. Similarly, any management applications that process the object identity definitions (e.g., to present the DESCRIPTION text to a user) will need to be get those definitions from the IANA-MAU-MIB instead of the MAU-MIB. While it is true that changes that require such adjustments are not strictly compliant with the SMIv2 rules

governing MIB module revisions (see [RFC2578] Section 10), in this case continued high maintenance costs that would result from not making these changes make the deviation from the rules justified. It should be noted that the working group was not able to find any examples of MIB modules or management applications that would actually be negatively affected by the changes.

3.2. Relationship to RFC 2668

RFC 3636 was a replacement for RFC 2668 [RFC2668]. RFC 3636 included all of the objects contained in RFC 2668, plus new and updated definitions to provide management support for 10 Gb/s devices.

3.3. Relationship to RFC 2239

RFC 2668 was a replacement for RFC 2239 [RFC2239]. RFC 2668 defined a superset of that defined by RFC 2239, which contained all of the objects defined in RFC 2239, plus several new ones which provide additional capabilities. The new objects provided management support for:

- management of 1000 Mb/s devices
- management of PAUSE negotiation
- management of remote fault status

3.4. Relationship to RFC 1515

RFC 2239 was a replacement for RFC 1515 [RFC1515]. RFC 2239 defined a superset of RFC 1515 which contained all of the objects defined in RFC 1515, plus several new ones which provided additional capabilities. The new objects in RFC 2239 provided management support for:

- management of 100 Mb/s devices
- auto-negotiation on interface MAUs
- jack management

3.5. Relationship to other MIBs

It is assumed that an agent implementing this MIB will also implement (at least) the 'system' group defined in the SNMPv2 MIB [RFC3418]. The following sections identify other MIBs that such an agent should implement.

3.5.1. Relationship to the Interfaces MIB

The sections of this document that define interface MAU-related objects specify an extension to the Interfaces MIB [RFC2863]. An agent implementing these interface-MAU related objects MUST also implement the relevant groups of the ifCompliance3 MODULE-COMPLIANCE statement of the Interface MIB. The value of the object ifMauIfIndex is the same as the value of 'ifIndex' used to instantiate the interface to which the given MAU is connected.

It is REQUIRED that an agent implementing the interface-MAU related objects in this MIB will also fully comply with the dot3Compliance2 MODULE-COMPLIANCE statement of the Ethernet-like Interfaces MIB, [RFC3635]. Furthermore, when the interface-MAU related objects are used to manage a 10GBASE-W PHY -- i.e., when ifMauType is equal to dot3MauType10GigBaseW or any other 10GBASE-W variant -- then the agent MUST also support the Ethernet WAN Interface Sublayer (WIS) MIB [RFC3637] and must follow the interface layering model specified therein. In that case the value of the object ifMauIfIndex is the same as the value of 'ifIndex' for the layer at the top of the stack, i.e., for the ifTable entry that has 'ifType' equal to ethernetCsmacd(6). If the interface-MAU related objects are used to manage a PHY that allows the MAU type to be changed dynamically, then the agent SHALL create ifTable, ifStackTable, and ifInvStackTable entries that pertain to the WIS when ifMauDefaultType is changed to a 10GBASEW variant (i.e., one of dot3MauType10GigBaseW, dot3MauType10GigBaseEW, dot3MauType10GigBaseLW, or dot3MauType10GigBaseSW) from any other type, and shall destroy the WIS-related entries when ifMauDefaultType is changed to a non-10GBASE-W type. The agent SHALL also change the values of 'ifConnectorPresent' and 'ifHighSpeed' in the ifTable entry indexed by ifMauIfIndex as specified in [RFC3635] and [RFC3637] when ifMauDefaultType is manipulated in this way but SHALL NOT otherwise alter that entry.

(Note that repeater ports are not represented as interfaces in the Interface MIB.)

3.5.2. Relationship to the 802.3 Repeater MIB module

The section of this document that defines repeater MAU-related objects specifies an extension to the 802.3 Repeater MIB defined in [RFC2108]. An agent implementing these repeater-MAU related objects MUST also comply with the snmpRptrModCompl compliance statement of the 802.3 Repeater MIB module.

The values of 'rpMauGroupIndex' and 'rpMauPortIndex' used to instantiate a repeater MAU variable SHALL be the same as the values

of 'rptrPortGroupIndex' and 'rptrPortIndex' used to instantiate the port to which the given MAU is connected.

3.6. Management of Internal MAUs

In some situations, a MAU can be "internal" -- i.e., its functionality is implemented entirely within a device. For example, a managed repeater may contain an internal repeater-MAU and/or an internal interface-MAU through which management communications originating on one of the repeater's external ports pass in order to reach the management agent associated with the repeater. Such internal MAUs may or may not be managed. If they are managed, objects describing their attributes should appear in the appropriate MIB subtree: dot3RpMauBasicGroup for internal repeater-MAUs and dot3IfMauBasicGroup for internal interface-MAUs.

3.7. Management of IEEE 802.3 Managed Objects

IEEE 802.3 Managed Object	Corresponding SNMP Object
oMAU	
.aMAUID	rpMauIndex or ifMauIndex or broadMauIndex
.aMAUType	rpMauType or ifMauType
.aMAUTypeList	ifMauTypeListBits
.aMediaAvailable	rpMauMediaAvailable or ifMauMediaAvailable
.aLoseMediaCounter	rpMauMediaAvailableStateExits or ifMauMediaAvailableStateExits
.aJabber	rpMauJabberState and rpMauJabberingStateEnters or ifMauJabberState and ifMauJabberingStateEnters
.aMAUAdminState	rpMauStatus or ifMauStatus
.aBbMAUXmitRcvSplitType	broadMauXmtRcvSplitType
.aBroadbandFrequencies	broadMauXmtCarrierFreq and broadMauTranslationFreq
.aFalseCarriers	rpMauFalseCarriers or ifMauFalseCarriers
.acResetMAU	rpMauStatus or ifMauStatus
.acMAUAdminControl	rpMauStatus or ifMauStatus
.nJabber	rpMauJabberTrap or ifMauJabberTrap
oAutoNegotiation	
.aAutoNegID	ifMauIndex
.aAutoNegAdminState	ifMauAutoNegAdminStatus

.aAutoNegRemoteSignalling	ifMauAutoNegRemoteSignalling
.aAutoNegAutoConfig	ifMauAutoNegConfig
.aAutoNegLocalTechnologyAbility	ifMauAutoNegCapabilityBits
.aAutoNegAdvertisedTechnologyAbility	ifMauAutoNegAdvertisedBits and ifMauAutoNegRemoteFaultAdvertised
.aAutoNegReceivedTechnologyAbility	ifMauAutoNegReceivedBits and ifMauAutoNegRemoteFaultReceived
.acAutoNegRestartAutoConfig	ifMauAutoNegRestart
.acAutoNegAdminControl	ifMauAutoNegAdminStatus

Table 1

The following IEEE 802.3 managed objects have not been included in this MIB for the following reasons.

IEEE 802.3 Managed Object	Corresponding SNMP Object
oMAU	
.aIdleErrorCount	Only useful for 100BaseT2, which is not widely implemented.
oAutoNegotiation	
.aAutoNegLocalSelectorAbility	Only needed for support of isoethernet (802.9a), which is not supported by this MIB.
.aAutoNegAdvertisedSelectorAbility	
.aAutoNegReceivedSelectorAbility	

Table 2

3.8. Addition of new MAU Types

3.8.1. dot3MauType OBJECT-IDENTITIES

The dot3MauType OBJECT IDENTIFIER and its OBJECT-IDENTITY definitions has been moved from the MAU-MIB into the IANA-maintained IANA-MAU-MIB, first version of which is defined in this memo.

When a new IEEE 802.3 MAU is defined, IANA can re-issue a version of IANA-MAU-MIB with the new dot3MauType OBJECT-IDENTITY and its matching IANAifMauTypeListBits textual convention value and, possibly, with new IANAifMauMediaAvailable, IANAifMauAutoNegCapBits

and/or IANAifJackType values.

An Expert Review, as defined in RFC 2434 [RFC2434], is REQUIRED for the addition of the new MAU, Media Available states, Auto Negotiation capabilities and/or Jack types.

In some cases new MAU types may require additional managed objects or may have side effects on the behavior of existing managed objects. In such cases a standards-track specification (which may be a new document or a revision of this document) is also REQUIRED. Any such document is REQUIRED to note any special properties of the MAU types that it defines - for example, side effects on the ifStackTable as noted in this document for 10GBASE-W MAUs.

3.8.2. IANAifMauTypeListBits Textual Convention

The syntax of ifMauTypeListBits is changed to be a textual convention, such that the enumerated integer values are now defined in the textual convention, IANAifMauTypeListBits, which can be re-specified (with additional values, when defined by IEEE 802.3) in the IANA-maintained MIB module, without issuing a new version of this document.

3.8.3. IANAifMauMediaAvailable Textual Convention

The syntax of ifMauMediaAvailable and rpMauMediaAvailable is changed a textual convention, such that the enumerated integer values are now defined in the textual convention, IANAifMauMediaAvailable, which can be re-specified (with additional values, when defined by IEEE 802.3) in the IANA-maintained MIB module, without issuing a new version of this document.

3.8.4. IANAifMauAutoNegCapBits Textual Convention

The syntax of ifMauAutoNegCapabilityBits, ifMauAutoNegCapAdvertisedBits and ifMauAutoNegCapReceivedBits objects is changed to be a textual convention, such that the enumerated integer values are now defined in the textual convention, IANAifMauAutoNegCapBits, which can be re-specified (with additional values, when defined by IEEE 802.3) in the IANA-maintained MIB module, without issuing a new version of this document.

3.8.5. JackType Textual Convention

The JackType Textual Convention has been deprecated in favor of IANAifJackType defined in the IANA-maintained MIB module, so the new Jack types can be added (when defined by IEEE 802.3) without issuing a new version of this document.

4. MAU MIB Definitions

```
MAU-MIB DEFINITIONS ::= BEGIN

  IMPORTS
    Counter32, Integer32, Counter64,
    OBJECT-TYPE, MODULE-IDENTITY, NOTIFICATION-TYPE, mib-2
      FROM SNMPv2-SMI          -- RFC 2578
    TruthValue, AutonomousType, TEXTUAL-CONVENTION

        DESCRIPTION
          "Management information for 802.3 MAUs.

          The following reference is used throughout this MIB module:

          [IEEE 802.3 Std] refers to:
             IEEE Std 802.3, 2002 Edition: 'IEEE Standard
             for Information technology -
             Telecommunications and information exchange
             between systems - Local and metropolitan
             area networks - Specific requirements -
             Part 3: Carrier sense multiple access with
             collision detection (CSMA/CD) access method
             and physical layer specifications', as
             amended by IEEE Std 802.3ae-2002:
             'Amendment: Media Access Control (MAC)
             Parameters, Physical Layer, and Management
             Parameters for 10 Gb/s Operation', August,
             2002.

          Of particular interest is Clause 30, '10Mb/s,
          100Mb/s, 1000Mb/s and 10 Gb/s Management'.

          Copyright (C) The Internet Society (2006).  This
          version of this MIB module is part of RFC XXXX;
          see the RFC itself for full legal notices."

        REVISION    "200606070000Z"  -- June 07, 2006
        DESCRIPTION "Updated to reference IANA maintaned textual
                     conventions for MAU types and jack types,
                     instead of using internally defined values.

                     This version is published as RFC XXXX."
    -- EdNote: Replace XXXX with the actual RFC number
    -- & remove this note.

        REVISION    "200309190000Z"  -- September 19, 2003
        DESCRIPTION "Updated to include support for 10 Gb/s MAUs.
                     This resulted in the following revisions:
                     - Added OBJECT-IDENTITY definitions for
                       10 gigabit MAU types
                     - Added fiberLC jack type to JackType TC
                     - Extended ifMauTypeListBits with bits for
                       the 10 gigabit MAU types
                     - Added enumerations to ifMauMediaAvailable,
                       and updated its DESCRIPTION to reflect
```

```
                  behaviour at 10 Gb/s
                - Added 64-bit version of ifMauFalseCarriers
                  and added mauIfGrpHCStats object group to
                  contain the new object
                - Deprecated mauModIfCompl2 and replaced it
                  with mauModIfCompl3, which includes the new
                  object group

                 This version published as RFC 3636."

      REVISION    "199908240400Z" -- August 24, 1999
      DESCRIPTION "This version published as RFC 2668.  Updated
                  to include support for 1000 Mb/sec
                  MAUs and flow control negotiation."

      REVISION    "199710310000Z" -- October 31, 1997
      DESCRIPTION "Version published as RFC 2239."

      REVISION    "199309300000Z" -- September 30, 1993
      DESCRIPTION "Initial version, published as RFC 1515."

                          shutdown(5),
                          reset(6)
                      }
          MAX-ACCESS  read-write
          STATUS      current
          DESCRIPTION "The current state of the MAU.  This object MAY
                      be implemented as a read-only object by those
                      agents and MAUs that do not implement software
                      control of the MAU state.  Some agents may not
                      support setting the value of this object to some
                      of the enumerated values.

                      The value other(1) is returned if the MAU is in
                      a state other than one of the states 2 through
                      6.

                      The value unknown(2) is returned when the MAU's
```

```
                    true state is unknown; for example, when it is
                    being initialized.

                    A MAU in the operational(3) state is fully
                    functional, operates, and passes signals to its
                    attached DTE or repeater port in accordance to
                    its specification.

                    A MAU in standby(4) state forces DI and CI to
                    idle and the media transmitter to idle or fault,
                    if supported.  Standby(4) mode only applies to
                    link type MAUs.  The state of
                    rpMauMediaAvailable is unaffected.

                    A MAU in shutdown(5) state assumes the same
                    condition on DI, CI, and the media transmitter
                    as though it were powered down or not connected.
                    The MAU MAY return other(1) value for the
                    rpMauJabberState and rpMauMediaAvailable objects
                    when it is in this state.  For an AUI, this
                    state will remove power from the AUI.

                    Setting this variable to the value reset(6)
                    resets the MAU in the same manner as a
                    power-off, power-on cycle of at least one-half
                    second would.  The agent is not required to
                    return the value reset (6).

                    Setting this variable to the value
                    operational(3), standby(4), or shutdown(5)
                    causes the MAU to assume the respective state
                    except that setting a mixing-type MAU or an AUI
                    to standby(4) will cause the MAU to enter the
                    shutdown state."

        DESCRIPTION "This object identifies the MAU type.  Values for
                    standard IEEE 802.3 MAU types are defined in the
                    IANA maintained IANA-MAU-MIB module, as
                    OBJECT-IDENTITIES of dot3MauType.
                    If the MAU type is unknown, the object identifier
                    zeroDotZero is returned.

                    This object represents the operational type of
                    the MAU, as determined by either (1) the result
                    of the auto-negotiation function or (2) if
                    auto-negotiation is not enabled or is not
                    implemented for this MAU, by the value of the
                    object ifMauDefaultType.  In case (2), a set to
                    the object ifMauDefaultType will force the MAU
                    into the new operating mode."
        REFERENCE   "[IEEE 802.3 Std], 30.5.1.1.2, aMAUType."
        ::= { ifMauEntry 3 }

      ifMauStatus OBJECT-TYPE
          SYNTAX      INTEGER {
                          other(1),
                          unknown(2),
                          operational(3),
                          standby(4),
                          shutdown(5),
                          reset(6)
                      }
          MAX-ACCESS  read-write
          STATUS      current
          DESCRIPTION "The current state of the MAU.  This object MAY
```

```
                    be implemented as a read-only object by those
                    agents and MAUs that do not implement software
                    control of the MAU state.  Some agents may not
                    support setting the value of this object to some
                    of the enumerated values.

                    The value other(1) is returned if the MAU is in
                    a state other than one of the states 2 through
                    6.

                    The value unknown(2) is returned when the MAU's
                    true state is unknown; for example, when it is
                    being initialized.

                    A MAU in the operational(3) state is fully
                    functional, operates, and passes signals to its
                    attached DTE or repeater port in accordance to
                    its specification.

                    A MAU in standby(4) state forces DI and CI to
                    idle and the media transmitter to idle or fault,
                    if supported.  Standby(4) mode only applies to
                    link type MAUs.  The state of
                    ifMauMediaAvailable is unaffected.

                    A MAU in shutdown(5) state assumes the same
                    condition on DI, CI, and the media transmitter
                    as though it were powered down or not connected.
                    The MAU MAY return other(1) value for the
                    ifMauJabberState and ifMauMediaAvailable objects
                    when it is in this state.  For an AUI, this
                    state will remove power from the AUI.

                    Setting this variable to the value reset(6)
                    resets the MAU in the same manner as a
                    power-off, power-on cycle of at least one-half
                    second would.  The agent is not required to
                    return the value reset (6).

                    Setting this variable to the value
                    operational(3), standby(4), or shutdown(5)
                    causes the MAU to assume the respective state
                    except that setting a mixing-type MAU or an AUI
                    to standby(4) will cause the MAU to enter the
                    shutdown state."

    ifMauTypeList OBJECT-TYPE
        SYNTAX      Integer32
        MAX-ACCESS  read-only
        STATUS      deprecated
        DESCRIPTION "********* THIS OBJECT IS DEPRECATED **********

                    This object has been deprecated in favour of
                    ifMauTypeListBits.

                    A value that uniquely identifies the set of
                    possible IEEE 802.3 types that the MAU could be.
                    The value is a sum which initially takes the
                    value zero.  Then, for each type capability of
                    this MAU, 2 raised to the power noted below is
                    added to the sum. For example, a MAU which has
                    the capability to be only 10BASE-T would have a
                    value of 512 (2**9).  In contrast, a MAU which
                    supports both 10Base-T (full duplex) and
                    100BASE-TX (full duplex) would have a value of
                    ((2**11) + (2**16)) or 67584.

                    The powers of 2 assigned to the capabilities are
                    these:

                    Power  Capability
                      0      other or unknown
                      1      AUI
                      2      10BASE-5
                      3      FOIRL
                      4      10BASE-2
                      5      10BASE-T duplex mode unknown
                      6      10BASE-FP
                      7      10BASE-FB
                      8      10BASE-FL duplex mode unknown
                      9      10BROAD36
                     10      10BASE-T  half duplex mode
                     11      10BASE-T  full duplex mode
                     12      10BASE-FL half duplex mode
                     13      10BASE-FL full duplex mode
                     14      100BASE-T4
```

```
                        15      100BASE-TX half duplex mode
                        16      100BASE-TX full duplex mode
                        17      100BASE-FX half duplex mode
                        18      100BASE-FX full duplex mode
                        19      100BASE-T2 half duplex mode
                        20      100BASE-T2 full duplex mode

                    If auto-negotiation is present on this MAU, this
                    object will map to ifMauAutoNegCapability."
        ::= { ifMauEntry 10 }

      ifMauDefaultType OBJECT-TYPE
          SYNTAX      AutonomousType
          MAX-ACCESS  read-write
          STATUS      current
          DESCRIPTION "This object identifies the default
                      administrative baseband MAU type, to be used in
                      conjunction with the operational MAU type
                      denoted by ifMauType.

                      The set of possible values for this object is
                      the same as the set defined for the ifMauType
                      object.

                      This object represents the
                      administratively-configured type of the MAU.  If
                      auto-negotiation is not enabled or is not
                      implemented for this MAU, the value of this
                      object determines the operational type of the
                      MAU.  In this case, a set to this object will
                      force the MAU into the specified operating mode.

                      If auto-negotiation is implemented and enabled
                      for this MAU, the operational type of the MAU
                      is determined by auto-negotiation, and the value
                      of this object denotes the type to which the MAU
                      will automatically revert if/when
                      auto-negotiation is later disabled.

                      NOTE TO IMPLEMENTORS:  It may be necessary to
                      provide for underlying hardware implementations
                      which do not follow the exact behavior specified
                      above.  In particular, when
                      ifMauAutoNegAdminStatus transitions from enabled
                      to disabled, the agent implementation MUST
                      ensure that the operational type of the MAU (as
                      reported by ifMauType) correctly transitions to
                      the value specified by this object, rather than
```

```
                    continuing to operate at the value earlier
                    determined by the auto-negotiation function."
        REFERENCE   "[IEEE 802.3 Std], 30.5.1.1.1, aMAUID, and
                    22.2.4.1.4."

                        enabled(1),
                        disabled(2)
                    }
        MAX-ACCESS  read-write
        STATUS      current
        DESCRIPTION "Setting this object to enabled(1) will cause
                    the interface which has the auto-negotiation
                    signaling ability to be enabled.

                    If the value of this object is disabled(2) then
                    the interface will act as it would if it had no
                    auto-negotiation signaling.  Under these
                    conditions, an IEEE 802.3 MAU will immediately
                    be forced to the state indicated by the value of
                    the object ifMauDefaultType.

                    NOTE TO IMPLEMENTORS:  When
                    ifMauAutoNegAdminStatus transitions from enabled
                    to disabled, the agent implementation MUST
                    ensure that the operational type of the MAU (as
                    reported by ifMauType) correctly transitions to
                    the value specified by the ifMauDefaultType
                    object, rather than continuing to operate at the
                    value earlier determined by the auto-negotiation
                    function."

        SYNTAX      Integer32
        MAX-ACCESS  read-only
        STATUS      deprecated
        DESCRIPTION "********** THIS OBJECT IS DEPRECATED **********

                    This object has been deprecated in favour of
                    ifMauAutoNegCapabilityBits.

                    A value that uniquely identifies the set of
                    capabilities of the local auto-negotiation
                    entity.  The value is a sum which initially
                    takes the value zero.  Then, for each capability
                    of this interface, 2 raised to the power noted
                    below is added to the sum. For example, an
                    interface which has the capability to support
                    only 100Base-TX half duplex would have a value
                    of 32768 (2**15).  In contrast, an interface
                    which supports both 100Base-TX half duplex and
                    and 100Base-TX full duplex would have a value of
                    98304 ((2**15) + (2**16)).

                    The powers of 2 assigned to the capabilities are
```

```
                    these:

                    Power   Capability
                      0       other or unknown
                     (1-9)    (reserved)
                     10       10BASE-T  half duplex mode
                     11       10BASE-T  full duplex mode
                     12       (reserved)
                     13       (reserved)
                     14       100BASE-T4
                     15       100BASE-TX half duplex mode
                     16       100BASE-TX full duplex mode
                     17       (reserved)
                     18       (reserved)
                     19      100BASE-T2 half duplex mode
                     20      100BASE-T2 full duplex mode

                    Note that interfaces that support this MIB may
                    have capabilities that extend beyond the scope
                    of this MIB."

       DESCRIPTION
         "This MIB module defines dot3MauType OBJECT-IDENTITIES and
         IANAifMauListBits, IANAifMauMediaAvailable,
         IANAifMauAutoNegCapBits and IANAifJackType Textual Conventions,
         specifying enumerated values of the ifMauTypeListBits,
         ifMauMediaAvailable / rpMauMediaAvailable,
         ifMauAutoNegCapabilityBits / ifMauAutoNegCapAdvertisedBits /
         ifMauAutoNegCapReceivedBits and ifJackType / rpJackType objects
         respectively, defined in the MAU-MIB.

         It is intended that each new MAU type, Media Availability
         state, Auto Negotiation capability and/or Jack type defined by
         the IEEE 802.3 working group and approved for publication in a
         revision of IEEE Std 802.3 will be added to this MIB module,
         provided that it is suitable for being managed by the base
         objects in the MAU-MIB. An Expert Review, as defined in
         RFC 2434 [RFC2434], is REQUIRED for such additions.

         The following reference is used throughout this MIB module:

         [IEEE 802.3 Std] refers to:
            IEEE Std 802.3, 2002 Edition: 'IEEE Standard for
            Information technology - Telecommunications and information
            exchange between systems - Local and metropolitan area
            networks - Specific requirements -
            Part 3: Carrier sense multiple access with collision
            detection (CSMA/CD) access method and physical layer
            specifications', as amended by the following specifications:
            IEEE Std 802.3ae-2002:
            'Amendment: Media Access Control (MAC) Parameters,
            Physical Layer, and Management Parameters for 10 Gb/s
            Operation', August 2002;
            IEEE Std 802.3ak-2004:
            'Amendment: Media Access Control (MAC) Parameters,
            Physical Layer, and Management Parameters for 10 Gb/s
            Operation, Type 10GBASE-CX4', March 2004;
```

```
            IEEE Std 802.3ah-2004:
            'Amendment: Media Access Control Parameters, Physical
            Layers and Management Parameters for Subscriber Access
            Networks', September 2004;.

          This reference should be updated as appropriate when new
          MAU types and/or Jack types are added to this MIB module.

    IANAifMauMediaAvailable ::= TEXTUAL-CONVENTION
      STATUS       current
      DESCRIPTION
        "This data type is used as the syntax of the
        ifMauMediaAvailable and rpMauMediaAvailable objects in the
        (updated) definition of MAU-MIB's ifMauTable and rpMauTable
        respectively.

        Possible values are:
          other(1)             - undefined (not listed below)
          unknown(2)           - MAU's true state is unknown; e.g.
                                 during initialization
          available(3)         - link, light, or loopback is normal
          notAvailable(4)      - link loss, low light, or no loopback
          remoteFault(5)       - a fault has been detected at the
                                 remote end of the link. This value
                                 applies to 10BASE-FB, 100BASE-T4 Far
                                 End Fault Indication and non-specified
                                 remote faults from a system running
                                 auto-negotiation
          invalidSignal(6)     - invalid signal has been received from
                                 the other end of the link, 10BASE-FB
                                 only
          remoteJabber(7)      - remote fault, due to jabber
          remoteLinkLoss(8)    - remote fault, due to link loss
          remoteTest(9)        - remote fault, due to test
          offline(10)          - offline, Clause 37 Auto-Negotiation
                                 only
          autoNegError(11)     - Auto-Negotiation Error, Clause 37
                                 Auto-Negotiation only
          pmdLinkFault(12)     - PMA/PMD receive link fault. In case of
                                 PAF, all PMA/PMDs in the aggregation
                                 group have detected a link fault
          wisFrameLoss(13)     - WIS loss of frame, 10GBASE-W only
          wisSignalLoss(14)    - WIS loss of signal, 10GBASE-W only
          pcsLinkFault(15)     - PCS receive link fault
          excessiveBER(16)     - PCS Bit Error Ratio monitor
                                 reporting excessive error ratio
          dxsLinkFault(17)     - DTE XGXS receive link fault, XAUI only
          pxsLinkFault(18)     - PHY XGXS receive link fault, XAUI only
          availableReduced(19) - link normal, reduced bandwidth,
                                 2BASE-TL / 10PASS-TS only
          ready(20)            - at least one PME available,
                                 2BASE-TL / 10PASS-TS only
```

If the MAU is a 10M b/s link or fiber type (FOIRL, 10BASE-T, 10BASE-F), then this is equivalent to the link test fail state/low light function. For an AUI, 10BASE2, 10BASE5, or 10BROAD36 MAU, this indicates whether or not loopback is detected on the DI circuit. The value of this attribute persists between packets for MAU types AUI, 10BASE5, 10BASE2, 10BROAD36, and 10BASEFP.
At power-up or following a reset, the Media Available state will be unknown(2) for AUI, 10BASE5, 10BASE2, 10BROAD36, and 10BASE-FP MAUs. For these MAUs loopback will be tested on each transmission during which no collision is detected.
If DI is receiving input when DO returns to IDL after a transmission and there has been no collision during the transmission, then loopback will be detected. The Media Available state will only change during noncollided transmissions for AUI, 10BASE2, 10BASE5, 10BROAD36, and 10BASE-FP MAUs.
For 100BASE-T2, 100BASE-T4, 100BASE-TX, 100BASE-FX, 100BASE-LX10 and 100BASE-BX10 PHYs the enumerations match the states within the link integrity state diagram. Any MAU that implements management of Clause 28 Auto-Negotiation will map remote fault indication to remoteFault(5).
Any MAU that implements management of Clause 37 Auto-Negotiation will map the received RF1 and RF2 bits as follows: Offline maps to offline(10), Link_Failure maps to remoteFault(5) and Auto-Negotiation Error maps to autoNegError(11).
The value remoteFault(5) applies to 10BASE-FB remote fault indication, the 100BASE-X far-end fault indication and nonspecified remote faults from a system running Clause 28 Auto-Negotiation.
The value remoteJabber(7), remoteLink loss(8), or remoteTest(9) SHOULD be used instead of remoteFault() where the reason for remote fault is identified in the remote signaling protocol.
Where a Clause 22 MII or Clause 35 GMII is present, a logic one in the remote fault bit maps to the value remoteFault(5), a logic zero in the link status bit maps to the enumeration notAvailable(4). The value notAvailable(4) takes precedence over remoteFault(5).
For 2BASE-TL and 10PASS-TS PHYs, the value unknown(2) maps to the condition where the PHY is initializing, the value ready(20) maps to the condition where at least one PME is available and is ready for handshake, the value available(3) maps to the condition where, at the PCS, at least one PME is operationally linked, the value notAvailable(4) maps to the condition where the PCS is not operationally linked, the value availableReduced(19) maps to the condition where a link fault is detected at the receive direction by one or more PMEs in the

```
        aggregation group and the enumeration pmdLinkFault(12) maps to
        the condition where a link fault is detected at the receive
        direction by all of the PMA/PMDs in the aggregation group.
        For 10 Gb/s the enumerations map to value of the link_fault
        variable within the Link Fault Signaling state diagram
        as follows: the value OK maps to the value available(3),
        the value Local Fault maps to the value notAvailable(4)
        and the value Remote Fault maps to the value remoteFault().
        The value pmdLinkFault(12), wisFrameLoss(13),
        wisSignalLoss(14), pcsLinkFault(15), excessiveBER(16) or
        dxsLinkFault(17) SHOULD be used instead of the value
        notAvailable(4) where the reason for the Local Fault state can
        be identified through the use of the Clause 45 MDIO Interface.
        Where multiple reasons for the Local Fault state can be
        identified only the highest precedence error SHOULD be
        reported. This precedence in descending order is as follows:
          pxsLinkFault
          pmdLinkFault
          wisFrameLoss
          wisSignalLoss
          pcsLinkFault
          excessiveBER
          dxsLinkFault.
        Where a Clause 45 MDIO interface is present a logic zero in
        the PMA/PMD Receive link status bit ([IEEE Std 802.3ah-2004]
        Section 45.2.1.2.2) maps to the
        value pmdLinkFault(12), a logic one in the LOF status bit
        (Section 45.2.2.10.4) maps to the value wisFrameLoss(13),
        a logic one in the LOS status bit (Section 45.2.2.10.5) maps
        to the value wisSignalLoss, a logic zero in the PCS Receive
        link status bit (Section 45.2.3.2.2) maps to the value
        pcsLinkFault(15), a logic one in the 10GBASE-R PCS Latched
        high BER status bit (Section 45.2.3.12.2) maps to the value
        excessiveBER, a logic zero in the DTE XS receive link status
        bit (Section 45.2.5.2.2) maps to the value dxsLinkFault(17)
        and a logic zero in the PHY XS transmit link status bit
        (Section 45.2.4.2.2) maps to the value pxsLinkFault(18).

6. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write. Setting these objects can have a serious effect on the operation of the network, including:

- enabling or disabling a MAU
- changing a MAU's default type
- enabling, disabling or restarting autonegotiation
- modifying the capabilities that a MAU advertizes during autonegotiation.

Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. In some environments it may be undesirable to allow unauthorized parties to access statistics or status information about individual links in a network. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is recommended that the implementors consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Furthermore, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

7. IANA Considerations

This document defines first version of the IANA-maintained MIB module. It is intended that each new MAU type, Media Available state, Auto Negotiation capability and/or Jack type defined by the IEEE 802.3 working group and approved for publication in a revision of IEEE Std 802.3 will be added to the IANA-maintaned module. An Expert Review, as defined in RFC 2434 [RFC2434], is REQUIRED.

8. Acknowledgments

This document was produced by the IETF Ethernet Interfaces and Hub MIB Working Group, whose efforts were greatly advanced by the contributions of the following people:

Mike Heard

John Flick

Dan Romascanu

This document is based on the Proposed Standard MAU MIB, RFC 3636 [RFC3636], edited by John Flick of Hewlett-Packard, and produced by the Ethernet Interfaces and Hub MIB Working Group. It extends that document by moving the object identities and textual conventions for MAU types into a IANA-maintained MIB module. In addition, support is provided for the EFM and 10GBASE-CX4 MAUs as defined in [IEEE802.3ah] and [IEEE802.3ak] respectively.

RFC 3636, in turn, was based on the Proposed Standard MAU MIB, RFC 2668 [RFC2668], edited by John Flick of Hewlett-Packard and Andrew Smith, then of Extreme Networks, and produced by the Ethernet Interfaces and Hub MIB Working Group. It extends that document by providing support for 10 Gb/s MAUs as defined in [IEEE802.3ae].

RFC 2668, in turn, was based on the Proposed Standard MAU MIB, RFC 2239 [RFC2239], edited by Kathryn de Graaf, then of 3Com, and Dan Romascanu, then of Madge Networks, and produced by the Ethernet Interfaces and Hub MIB Working Group. It extended that document by providing support for 1000 Mb/sec MAUs as defined in [IEEE802.3].

RFC 2239, in turn, was based on the Proposed Standard MAU MIB, RFC 1515 [RFC1515], edited by Donna McMaster, then of SynOptics Communications, Keith McCloghrie, then of Hughes LAN Systems, and Sam Roberts, then of Farallon Computing, and produced by the Hub MIB Working Group. It extends that document by providing support for 100 Mb/sec MAUs, full duplex MAUs, and auto-negotiation, as defined in [IEEE802.3].
