BGP Administrative Shutdown with Additional Communication
draft-ietf-idr-shutdown-01

Abstract

This document enhances the BGP Cease NOTIFICATION message "Administrative Shutdown" subcode for operators to transmit a short freeform message to describe why a BGP session was shutdown.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on June 3, 2017.

1. Introduction

It can be troublesome for an operator to correlate a BGP-4 [RFC4271] session teardown in the network with a notice that was transmitted via off-line methods such email or telephone calls. This document specifies a mechanism to transmit a short freeform UTF-8 [RFC3629] encoded string with a REQUIRED maximum length of 128 octets. The contents of the string are at the operator's discretion.

2. Shutdown Communication

If a BGP speaker decides to terminate its session with a BGP neighbor, then the BGP speaker MAY send to the neighbor a NOTIFICATION message with the Error Code "Cease" and the Error Subcode "Administrative Shutdown" followed by a freeform UTF-8 encoded string with a REQUIRED maximum length of 128 octets. The contents of the string are at the operator's discretion.

The Shutdown Communication Cease NOTIFICATION message is encoded as below:
The Length value can range from 0 to 128 and indicates how many octets of Shutdown Communication follow.

To support international characters, the Shutdown Communication field MUST be encoded using UTF-8.

The sending BGP speaker SHOULD avoid octet values below 32 (control characters), however these values are legal. Following UNICODE TR36 [UTR36], Sec 3.1, the sending BGP speaker MUST encode messages in the "shortest form" and MUST NOT interpret messages in the "non-shortest form". A receiving BGP speaker MUST NOT interpret invalid UTF-8 sequences.

Mechanisms concerning the reporting of information contained in the Shutdown Communication are implementation specific but SHOULD include methods such as SYSLOG [RFC5424].

3. Operational Considerations

Operators are encouraged to use the Shutdown Communication to inform their peers of the reason for the shutdown of the BGP session and include out-of-band reference materials. An example of a useful Shutdown Communication would be:

"[TICKET-1-1438367390] software upgrade, back in 2 hours"
"[TICKET-1-1438367390]" is a ticket reference with significance to both the sender and receiver, followed by a brief human readable message regarding the reason for the BGP session shutdown followed by an indication about the length of the maintenance. The receiver can now use the string 'TICKET-1-1438367390' to search in their email archive to find more details.

4. Error Handling

Any erroneous or malformed Shutdown Communication received SHOULD be logged for the attention of the operator and then MAY be discarded.

5. IANA Considerations

Per this document, IANA is requested to reference this document at subcode "Administrative Shutdown" in the "Cease NOTIFICATION message subcodes" registry under the "Border Gateway Protocol (BGP) Parameters" group.

6. Security Considerations

This document uses UTF-8 encoding for the Shutdown Communication. There are a number of security issues with UNICODE. Implementers and operator are advised to review UNICODE TR36 [UTR36] to learn about these issues. This document guards against the technical issues outlined in UTR36 by REQUIRING "shortest form" encoding. However, the visual spoofing due to character confusion still persists. This document tries to minimize the effects of visual spoofing by allowing UNICODE only where local script is expected and needed, and by limiting the length of the Shutdown Communication.

7. Implementation status - RFC EDITOR: REMOVE BEFORE PUBLICATION

This section records the status of known implementations of the protocol defined by this specification at the time of posting of this Internet-Draft, and is based on a proposal described in [RFC7942]. The description of implementations in this section is intended to assist the IETF in its decision processes in progressing drafts to RFCs. Please note that the listing of any individual implementation here does not imply endorsement by the IETF. Furthermore, no effort has been spent to verify the information presented here that was
supplied by IETF contributors. This is not intended as, and must not be construed to be, a catalog of available implementations or their features. Readers are advised to note that other implementations may exist.

As of today these vendors have produced an implementation of the Shutdown Communication:

- ExaBGP
