IMAP Extension for Conditional STORE operation

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#). Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>. The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

Often, multiple IMAP clients need to coordinate changes to a common IMAP mailbox. Examples include different clients for the same user, and multiple users accessing shared mailboxes. These clients need a mechanism to synchronize state changes for messages within the mailbox. They must be able to guarantee that only one client can change message state (e.g., message flags or annotations) at any time. An example of such an application is use of an IMAP mailbox as a message queue with multiple dequeuing clients.

The Conditional Store facility provides a protected update mechanism for message state information that can detect and resolve conflicts between multiple writing mail clients.

[1. Conventions Used in This Document](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[KEYWORDS](#)].

In examples, lines beginning with "S:" are sent by the IMAP server, and lines beginning with "C:" are sent by the client. Line breaks may appear in example commands solely for editorial clarity; when present in the actual message they are represented by "CRLF".

Formal syntax is defined using ABNF [[ABNF](#)] as modified by [[IMAP4](#)].

The term "metadata" or "metadata item" is used throughout this document. It refers to any system or user defined keyword or an annotation [[ANNOTATE](#)].

Some IMAP mailboxes are private, accessible only to the owning user. Other mailboxes are not, either because the owner has set an ACL [[ACL](#)] which permits access by other users, or because it is a shared mailbox. Let's call a metadata item "shared" for the mailbox if any changes to the metadata items are persistent and visible to all other users accessing the mailbox. Otherwise the metadata item is called "private". Note, that private metadata items are still visible to all

sessions accessing the mailbox as the same user. Also note, that different mailboxes may have different metadata items as shared.

See the next section for the definition of a "CONDSTORE-aware client" and a "CONDSTORE enabling command".

2. Introduction and Overview

The Conditional STORE extension is present in any IMAP4 implementation which returns "CONDSTORE" as one of the supported capabilities in the CAPABILITY command response.

Every IMAP message has an associated positive unsigned 64-bit value called a modification sequence (mod-sequence). This is an opaque value updated by the server whenever a metadata item is modified. The value is intended to be used only for comparisons within a server. However, the server MUST guarantee that each STORE command performed on the same mailbox, including simultaneous stores to different metadata items from different connections, will get a different mod-sequence value. Also, for any two successful STORE operations performed in the same session on the same mailbox, the mod-sequence of the second completed operation MUST be greater than the mod-sequence of the first completed. Note that the latter rule disallows the use of the system clock as a mod-sequence, because if system time changes (e.g., a NTP [\[NTP\]](#) client adjusting the time), the next generated value might be less than the previous one.

Mod-sequences allow a client that supports the CONDSTORE extension to determine if a message metadata has changed since some known moment. Whenever the state of a flag changes (i.e., the flag is added and before it wasn't set, or the flag is removed and before it was set) the value of the modification sequence for the message MUST be updated. Adding the flag when it is already present or removing when it is not present SHOULD NOT change the mod-sequence.

When a message is appended to a mailbox (via the IMAP APPEND command, COPY to the mailbox or using an external mechanism) the server generates a new modification sequence that is higher than the highest modification sequence of all messages in the mailbox and assigns it to the appended message.

When an annotation is added, modified or removed the corresponding message mod-sequence MUST be updated.

The server MAY store separate (per message) modification sequence values for different metadata items. If the server does so, per message mod-sequence

is

the highest mod-sequence of all metadata items for the specified message.

The server that supports this extension is not required to be able to store mod-sequences for every available mailbox. [Section 3.1.2](#) describes how the server may act if a particular mailbox doesn't support the persistent storage of mod-sequences.

This extension makes the following changes to the IMAP4 protocol:

- a) extends the syntax of the STORE command to allow STORE modifiers
- b) adds the MODIFIED response code which should be used with an OK response to the STORE command
- c) adds a new MODSEQ message data item for use with the FETCH command
- d) extends the syntax of the FETCH command to allow FETCH modifiers
- e) adds a new MODSEQ search criterion
- f) extends the syntax of untagged SEARCH responses to include mod-sequence
- g) adds new OK untagged responses for the SELECT and EXAMINE commands
- h) defines an additional parameter to SELECT/EXAMINE commands
- i) adds the HIGHESTMODSEQ status data item to the STATUS command

A client supporting CONDSTORE extension indicates its willingness to receive

mod-sequence updates in all untagged FETCH responses by issuing a SELECT or EXAMINE command with the CONDSTORE parameter, or a FETCH, SEARCH, or SORT (if it also supports SORT=MODSEQ extension, see below) command that includes

the MODSEQ message data item, a FETCH command with the CHANGEDSINCE modifier,

or a STORE command with the UNCHANGEDSINCE modifier.

The server will include mod-sequence data in all FETCH responses, whether they

were caused by a regular STORE, STORE with UNCHANGEDSINCE modifier, or an external

agent, until the connection is closed.

This document uses the term "CONSTORE-aware client" to refer to a client that announces its willingness to receive mod-sequence updates as described above. The term "CONDSTORE enabling command" will refer any of the commands listed above. A first CONDSTORE enabling command executed in the session MUST cause the server to return HIGHESTMODSEQ ([section 3.1.1](#)) unless the

server has sent NOMODSEQ ([section 3.1.2](#)) response code when the currently selected mailbox was selected.

This document also defines a new SORT extension with a capability name "SORT=MODSEQ". This extension is upwards compatible with the SORT extension defined in [[SORT](#)]. Server implementations that support both the CONDSTORE and

SORT extensions SHOULD also support the SORT=MODSEQ extension. The SORT=MODSEQ extension makes the following additions to the SORT extension:

- a) extends syntax of untagged SORT responses to include mod-sequence (see [section 3.6](#))
- b) adds a new MODSEQ sort criterion (see sections [3.4](#) and [3.5](#))

The rest of this document describes the protocol changes more rigorously.

[3. IMAP Protocol Changes](#)

[3.1. New OK untagged responses for SELECT and EXAMINE](#)

This document adds two new response codes HIGHESTMODSEQ and NOMODSEQ. One of those response codes MUST be returned in the OK untagged response for a successful SELECT and EXAMINE commands.

When opening a mailbox the server must check if the mailbox supports the persistent storage of mod-sequences. If the mailbox supports the persistent storage of mod-sequences and mailbox open operation succeeds,
the server MUST send the OK untagged response including HIGHESTMODSEQ response code. If the persistent storage for the mailbox is not supported, the server MUST send the OK untagged response including NOMODSEQ response code instead.

[3.1.1. HIGHESTMODSEQ response code](#)

This document adds a new response code that is returned in the OK untagged response for the SELECT and EXAMINE commands. A server supporting the persistent storage of mod-sequences for the mailbox MUST send the OK untagged response including HIGHESTMODSEQ response code with every successful SELECT or EXAMINE command:

OK [HIGHESTMODSEQ <mod-sequence-value>]

Where <mod-sequence-value> is the highest mod-sequence value of all messages in the mailbox. When the server changes UIDVALIDITY for a mailbox, it doesn't have to keep the same HIGHESTMODSEQ for the mailbox.

A disconnected client can use the value of HIGHESTMODSEQ to check if

it has to refetch flags and/or annotations from the server. If the UIDVALIDITY value has changed for the selected mailbox, the client MUST delete the cached value of HIGHESTMODSEQ. If UIDVALIDITY for the mailbox is the same and if the HIGHESTMODSEQ value stored in the client's cache is less than the value returned by the server, then some metadata items on the server have changed since the last synchronization, and the client needs to update its cache. The client MAY use SEARCH MODSEQ as described in [section 3.4](#) to find out exactly which metadata items have changed. Alternatively the client MAY issue FETCH with CHANGEDSINCE modifier ([section 3.3.1](#)) in order to fetch data for all messages that have metadata items changed since some known modification sequence.

Example: C: A142 SELECT INBOX
S: * 172 EXISTS
S: * 1 RECENT
S: * OK [UNSEEN 12] Message 12 is first unseen
S: * OK [UIDVALIDITY 3857529045] UIDs valid
S: * OK [UIDNEXT 4392] Predicted next UID
S: * FLAGS (\Answered \Flagged \Deleted \Seen \Draft)
S: * OK [PERMANENTFLAGS (\Deleted \Seen *)] Limited
S: * OK [HIGHESTMODSEQ 20010715194045007]
S: A142 OK [READ-WRITE] SELECT completed

[3.1.2](#) NOMODSEQ response code

A server that doesn't support the persistent storage of mod-sequences for the mailbox MUST send the OK untagged response including NOMODSEQ response code with every successful SELECT or EXAMINE command.

Example: C: A142 SELECT INBOX
S: * 172 EXISTS
S: * 1 RECENT
S: * OK [UNSEEN 12] Message 12 is first unseen
S: * OK [UIDVALIDITY 3857529045] UIDs valid
S: * OK [UIDNEXT 4392] Predicted next UID
S: * FLAGS (\Answered \Flagged \Deleted \Seen \Draft)
S: * OK [PERMANENTFLAGS (\Deleted \Seen *)] Limited
S: * OK [NOMODSEQ] Sorry, this mailbox format doesn't support
modsequences
S: A142 OK [READ-WRITE] SELECT completed

[3.2.](#) STORE and UID STORE Commands

Arguments: message set
OPTIONAL store modifiers
message data item name
value for message data item

Responses: untagged responses: FETCH

Result: OK - store completed
NO - store error: can't store that data
BAD - command unknown or arguments invalid

This document extends the syntax of the STORE and UID STORE commands (see section 6.4.6 of [\[IMAP4\]](#)) to include an optional STORE modifier. The document defines the following modifier:

UNCHANGEDSINCE <mod-sequence>

For each message specified in the message set the server performs the following. If the mod-sequence of any metadata item of the message is equal or less than the specified UNCHANGEDSINCE value, then the requested operation (as described by the message data item) is performed. If the operation is successful the server MUST update the mod-sequence attribute of the message. An untagged FETCH response MUST be sent (even if the .SILENT suffix is specified or ANNOTATION message data item is used; the latter changes the behavior described in Section 9.4 of [\[ANNOTATE\]](#)) and the response MUST include the MODSEQ message data item. This is required to update the client's cache with the

correct

mod-sequence values. See [section 3.3.2](#) for more details.

However, if the mod-sequence of any metadata item of the message is greater than the specified UNCHANGEDSINCE value, than the requested operation MUST NOT be performed. In this case, the mod-sequence attribute of the message is not updated, and the message number (or unique identifier in the case of the UID STORE command) is added to the list of messages that failed the

UNCHANGESINCE test.

When the server finished performing the operation on all the

messages

in the message set, it checks for a non-empty list of messages that failed the UNCHANGESINCE test. If this list is non-empty, the

server MUST

return in the tagged response a MODIFIED response code. The

MODIFIED

response code includes the message set (for STORE) or set of UIDs (for UID STORE) of all messages that failed the UNCHANGESINCE test.

Example :

All messages pass the UNCHANGESINCE test.

```
C: a103 UID STORE 6,4,8 (UNCHANGEDSINCE 200012121230045)
  +FLAGS.SILENT (\Deleted)
S: * 1 FETCH (UID 4 MODSEQ (200012121231000))
```

```
S: * 2 FETCH (UID 6 MODSEQ (200012101230852))
S: * 4 FETCH (UID 8 MODSEQ (20001211130956))
S: a103 OK Conditional Store completed
```

Example:

```
C: a104 STORE * (UNCHANGEDSINCE 200012121230045) +FLAGS.SILENT
(\Deleted $Processed)
S: * 50 FETCH (MODSEQ (200012111230047))
S: a104 OK Store (conditional) completed
```

Example:

```
C: c101 STORE 1 (UNCHANGEDSINCE 200012121230045) ANNOTATION
("/message/comment" ("value.priv" "My new comment"))
S: * OK [HIGHESTMODSEQ 200012111230047]
S: * 50 FETCH (MODSEQ (200012111230048))
S: c101 OK Store (conditional) completed
```

HIGHESTMODSEQ response code was sent by the server presumably because this was the first CONDSTORE enabling command.

Example:

In spite of the failure of the conditional STORE operation for message 7, the server continues to process the conditional STORE in order to find all messages which fail the test.

```
C: a105 STORE 7,5,9 (UNCHANGEDSINCE 20000320162338)
+FLAGS.SILENT (\Deleted)
S: * 5 FETCH (MODSEQ (20000320162350))
S: a105 OK [MODIFIED 7,9] Conditional STORE failed
```

Example:

Same as above, but the server follows SHOULD recommendation in section 6.4.6 of [\[IMAP4\]](#).

```
C: a105 STORE 7,5,9 (UNCHANGEDSINCE 20000320162338)
+FLAGS.SILENT (\Deleted)
S: * 7 FETCH (MODSEQ (20000320162342) FLAGS (\Seen \Deleted))
S: * 5 FETCH (MODSEQ (20000320162350))
S: * 9 FETCH (MODSEQ (20000320162349) FLAGS (\Answered))
S: a105 OK [MODIFIED 7,9] Conditional STORE failed
```

Use of UNCHANGEDSINCE with a modification sequence of 0 always fails if the metadata item exists. A system flag MUST always be considered existent, whether it was set or not.

Example:

```
C: a102 STORE 12 (UNCHANGEDSINCE 0)
  +FLAGS.SILENT ($MDNSent)
S: a102 OK [MODIFIED 12] Conditional STORE failed
```

particular
code
because
metadata

Note: A client trying to make an atomic change to the state of a metadata item (or a set of metadata items) should be prepared to deal with the case when the server returns MODIFIED response if the state of the metadata item being watched hasn't changed (but the state of some other metadata item has). This is necessary, some servers don't store separate mod-sequences for different items. However, a server implementation SHOULD avoid generating spurious MODIFIED responses for +FLAGS/-FLAGS STORE operations, even when the server stores a single mod-sequence per message.

Upon the receipt of MODIFIED response code the client SHOULD try to figure out if the required metadata items have indeed changed. If they haven't the client SHOULD retry the command.

Example:

```
C: a106 STORE 100:150 (UNCHANGEDSINCE 2002120300000000)
  +FLAGS.SILENT ($Processed)
S: * 100 FETCH (MODSEQ (200303181230852))
S: * 102 FETCH (MODSEQ (200303181230852))
...
S: * 150 FETCH (MODSEQ (200303181230852))
S: a106 OK [MODIFIED 101] Conditional STORE failed
```

the flag \$Processed was set on the message 101 ...

```
C: a107 NOOP
S: * 101 FETCH (MODSEQ (200303011130956) FLAGS ($Processed))
S: a107 OK
```

Or the flag hasn't changed ...

```
C: b107 NOOP
S: * 101 FETCH (MODSEQ (200303011130956) FLAGS (\Deleted
\Answered))
S: b107 OK
```

... and the client retries the operation for the message 100 with the updated UNCHANGEDSINCE value

```
C: b108 STORE 100 (UNCHANGEDSINCE 200303011130956)
  +FLAGS.SILENT ($Processed)
S: * 100 FETCH (MODSEQ (200303181230852))
S: b108 OK Conditional Store completed
```

Example:

The following example is based on the example from the [section 4.2.3 of \[RFC-2180\]](#) and demonstrates that the MODIFIED response code may be also

returned in the tagged NO response.

Client tries to conditionally STORE flags on a mixture of expunged and non-expunged messages, one message fails the UNCHANGEDSINCE test.

```
C: B001 STORE 1:7 (UNCHANGEDSINCE 20000320172338) +FLAGS (\SEEN)
S: * 1 FETCH (MODSEQ (20000320172342) FLAGS (\SEEN))
S: * 3 FETCH (MODSEQ (20000320172342) FLAGS (\SEEN))
S: B001 NO [MODIFIED 2] Some of the messages no longer exist.

C: B002 NOOP
S: * 4 EXPUNGE
S: * 4 EXPUNGE
S: * 4 EXPUNGE
S: * 4 EXPUNGE
S: * 2 FETCH (MODSEQ (20000320172340) FLAGS (\Deleted \Answered))
S: B002 OK NOOP Completed.
```

By receiving FETCH responses for messages 1 and 3, and EXPUNGE responses that indicate that messages 4:7 have been expunged, the client retries the operation only for the message 2. The updated UNCHANGEDSINCE value is used.

```
C: b003 STORE 2 (UNCHANGEDSINCE 20000320172340) +FLAGS (\Seen)
S: * 2 FETCH (MODSEQ (20000320180050))
S: b003 OK Conditional Store completed
```

Note: If a message is specified multiple times in the message set, and the server doesn't internally eliminate duplicates from the message set, it MUST NOT fail the conditional STORE operation for the second (or subsequent) occurrence of the message if the operation completed successfully for the first occurrence. For example, if the client specifies:

```
a105 STORE 7,3:9 (UNCHANGEDSINCE 200012121230045)
+FLAGS.SILENT (\Deleted)
```

the server must not fail the operation for message 7 as part of processing "3:9" if it succeeded when message 7 was processed the first time.

Once the client specified the UNCHANGEDSINCE modifier in a STORE command,
the server MUST include the MODSEQ fetch response data items in all subsequent unsolicited FETCH responses.

This document also changes the behaviour of the server when it has performed

a STORE or UID STORE command and the UNCHANGEDSINCE modifier is not specified.

If the operation is successful for a message, the server MUST update the mod-sequence attribute of the message. The server is REQUIRED to include the mod-sequence value whenever it decides to send the unsolicited FETCH response to all CONDSTORE-aware clients that have opened
the mailbox containing the message.

3.3 FETCH and UID FETCH Commands

3.3.1 FETCH modifiers

Arguments: sequence set
message data item names or macro

Responses: untagged responses: FETCH

Result: OK - fetch completed
NO - fetch error: can't fetch that data
BAD - command unknown or arguments invalid

This document extends the syntax of the FETCH and UID FETCH commands (see section 6.4.5 of [\[IMAP4\]](#)) to include an optional FETCH modifier. The document defines the following modifier:

CHANGEDSINCE <mod-sequence>

CHANGEDSINCE FETCH modifier allows to further subset the list of messages described by sequence set. The information described by message data items is only returned for messages that have mod-sequence bigger than <mod-sequence>.

When CHANGEDSINCE FETCH modifier is specified, it implicitly adds MODSEQ FETCH message data item ([section 3.3.2](#)).

Example:

```
C: s100 UID FETCH 1:* (FLAGS) (CHANGEDSINCE 12345)
S: * 1 FETCH (UID 4 MODSEQ (65402) FLAGS (\Seen))
S: * 2 FETCH (UID 6 MODSEQ (75403) FLAGS (\Deleted))
S: * 4 FETCH (UID 8 MODSEQ (29738) FLAGS ($NoJunk $AutoJunk
$MDNSent))
S: s100 OK FETCH completed
```

3.3.2 MODSEQ message data item in FETCH Command

This extension adds a MODSEQ message data item to the FETCH command. The MODSEQ message data item allows clients to retrieve mod-sequence values for a range of messages in the currently selected mailbox.

Once the client specified the MODSEQ message data item in a FETCH request, the server **MUST** include the MODSEQ fetch response data items in all subsequent unsolicited FETCH responses.

Syntax: MODSEQ

The MODSEQ message data item causes the server to return MODSEQ fetch response data items.

Syntax: MODSEQ (<permseq-modsequence>)

MODSEQ response data items contain per-message mod-sequences.

The MODSEQ response data item is returned if the client issued FETCH with MODSEQ message data item. It also allows the server to notify the client about mod-sequence changes caused by conditional STOREs ([section 3.2](#)) and/or changes caused by external sources.

Example:

```
C: a FETCH 1:3 (MODSEQ)
S: * 1 FETCH (MODSEQ (20000624140003))
S: * 2 FETCH (MODSEQ (20000624140007))
S: * 3 FETCH (MODSEQ (20000624140005))
S: a OK Fetch complete
```

In this example the client requests per message mod-sequences for a set of messages.

When a flag for a message is modified in a different session, the server sends an unsolicited FETCH response containing the mod-sequence for the message.

Example:

(Session 1, authenticated as a user "alex"). The user adds a shared flag \Deleted:

```
C: A142 SELECT INBOX
```

```
...
S: * FLAGS (\Answered \Flagged \Deleted \Seen \Draft)
S: * OK [PERMANENTFLAGS (\Answered \Deleted \Seen \*)] Limited
...
```

```
C: A160 STORE 7 +FLAGS.SILENT (\Deleted)
S: * 7 FETCH (MODSEQ (200012121231000))
S: A160 OK Store completed
```

flags
in
(Session 2, also authenticated as the user "alex"). Any changes to
are always reported to all sessions authenticated as the same user as
the session 1.

```
C: C180 NOOP
S: * 7 FETCH (FLAGS (\Deleted \Answered) MODSEQ (200012121231000))
S: C180 OK Noop completed
```

(Session 3, authenticated as a user "andrew"). As \Deleted is a shared
flag, changes in the session 1 are also reported in the session 3:

```
C: D210 NOOP
S: * 7 FETCH (FLAGS (\Deleted \Answered) MODSEQ (200012121231000))
S: D210 OK Noop completed
```

The user modifies a private flag \Seen in the session 1 ...

```
C: A240 STORE 7 +FLAGS.SILENT (\Seen)
S: * 7 FETCH (MODSEQ (200012121231777))
S: A240 OK Store completed
```

... which is only reported in the session 2 ...

```
C: C270 NOOP
S: * 7 FETCH (FLAGS (\Deleted \Answered \Seen) MODSEQ
(200012121231777))
S: C270 OK Noop completed
```

... but not in the session 3.

```
C: D300 NOOP
S: D300 OK Noop completed
```

And finally the user removes flags \Answered (shared) and \Seen
(private)
in the session 1.

```
C: A330 STORE 7 -FLAGS.SILENT (\Answered \Seen)
S: * 7 FETCH (MODSEQ (200012121245160))
S: A330 OK Store completed
```

Both changes are reported in the session 2 ...

```
C: C360 NOOP
S: * 7 FETCH (FLAGS (\Deleted) MODSEQ (200012121245160))
S: C360 OK Noop completed
```

... and only changes to shared flags are reported in session 3.

```
C: D390 NOOP
S: * 7 FETCH (FLAGS (\Deleted) MODSEQ (200012121245160))
S: D390 OK Noop completed
```

3.4. MODSEQ search criterion in SEARCH

The MODSEQ criterion for the SEARCH command allows a client to search for the metadata items that were modified since a specified moment.

Syntax: MODSEQ [<entry-name> <entry-type-req>] <mod-sequence-valzer>

Messages that have modification values which are equal to or greater than <mod-sequence-valzer>. This allows a client, for example, to find out which messages contain metadata items that have changed since the last time it updated its disconnected cache. The client may also specify <entry-name> (name of metadata item) and <entry-type-req> (type of metadata item) before <mod-sequence-valzer>. <entry-type-req> can be one of "shared", "priv" (private) or "all". The latter means that the server should

use

the biggest value among "priv" and "shared" mod-sequences for the metadata item. If the server doesn't store internally separate mod-sequences for different metadata items, it MUST ignore <entry-name> and <entry-type-req>. Otherwise the server should use them to narrow down the search.

For a flag <flagname> the corresponding <entry-name> has a form "/flags/<flagname>" as defined in [\[ANNOTATE\]](#). Note, that the leading "\" character that denotes a system flag has to be escaped as per Section 4.3 of [\[IMAP4\]](#), as the <entry-name> uses syntax for quoted strings.

If client specifies a MODSEQ criterion in a SEARCH command and the server returns a non-empty SEARCH result, the server MUST also append (to the end of the untagged SEARCH response) the highest mod-sequence for all messages being returned. See also [section 3.6](#).

Example:

```
C: a SEARCH MODSEQ "/flags/\\draft" all 20010320162338
      ANNOTATION "/comment" "value" "IMAP4"
S: * SEARCH 2 5 6 7 11 12 18 19 20 23 (MODSEQ 20010917162500)
S: a OK Search complete
```

In the above example, the message numbers of any messages containing the string "IMAP4" in the "value" attribute of the "/comment" entry and having a mod-sequence equal to or greater than 20010320162338 for the "\Draft" flag are returned in the search results.

Example:

```
C: a SEARCH OR NOT MODSEQ 20010320162338 LARGER 50000
S: * SEARCH
S: a OK Search complete, nothing found
```

3.5. MODSEQ Sort Criterion

If a server implementing CONDSTORE also implements the SORT extension as defined by [\[SORT\]](#), it SHOULD implement the SORT=MODSEQ extension that allows for sorting on per-message mod-sequence. SORT=MODSEQ extension adds MODSEQ sort criterion that allows to sort the matching messages based on their mod-sequence.

If client specifies a MODSEQ search (as per [section 3.4](#)) or sort criterion in the SORT command and the server returns a non-empty SORT result, the server MUST also append (to the end of the untagged SORT response) the highest mod-sequence for all messages being returned. See also [section 3.6](#).

Example (MODSEQ search criterion):

```
C: A282 SORT (SUBJECT MODSEQ) UTF-8 SINCE 1-Feb-2001
S: * SORT 2 81 83 84 82 882 (MODSEQ 117)
S: A282 OK SORT completed
```

Example (MODSEQ sort criterion):

```
C: A283 SORT (SUBJECT REVERSE DATE) UTF-8 MODSEQ 21
S: * SORT 6 3 4 5 2 (MODSEQ 125)
S: A283 OK SORT completed
```

Example (MODSEQ search criterion and MODSEQ SORT criterion,
but no messages matching the search criteria):

```
C: A284 SORT (MODSEQ) KOI8-R OR NOT MODSEQ 20010320162338
      SUBJECT "Privet"
S: * SORT
S: A284 OK Sort complete, nothing found
```

3.6. Modified SEARCH and SORT untagged responses

```
Data:      zero or more numbers
           mod-sequence value (omitted if no match)
```

This document extends syntax of the untagged SEARCH and SORT responses to include mod-sequence for all messages being returned.

If a client specifies a MODSEQ criterion in a SEARCH (or UID SEARCH) command and the server returns a non-empty SEARCH result, the server MUST also append (to the end of the untagged SEARCH response) the highest mod-sequence for all messages being returned. See [section 3.4](#) for examples.

If client specifies a MODSEQ search or sort criterion in a SORT (or UID SORT) command and the server returns a non-empty SORT result, the server MUST also append (to the end of the untagged SORT response) the highest mod-sequence for all messages being returned. See [section 3.5](#) for examples.

[3.7.](#) HIGHESTMODSEQ status data items

This document defines a new status data item:

HIGHESTMODSEQ

The highest mod-sequence value all messages in the mailbox. This is the same value that is returned by the server in the HIGHESTMODSEQ response code in OK untagged response (see [section 3.1.1](#)).

Example: C: A042 STATUS blurrybloop (UIDNEXT MESSAGES HIGHESTMODSEQ)
S: * STATUS blurrybloop (MESSAGES 231 UIDNEXT 44292
HIGHESTMODSEQ 200201011231777)
S: A042 OK STATUS completed

[3.8.](#) CONDSTORE parameter to SELECT and EXAMINE

The CONDSTORE extension defines a single optional select parameter "CONDSTORE", which tells the server that it MUST include the MODSEQ fetch response data items in all subsequent unsolicited FETCH responses.

The CONDSTORE parameter to SELECT/EXAMINE helps to avoid a race condition that might arise when a metadata item(s) is(are) modified in another session

after the server has sent the HIGHESTMODSEQ response code and before the client was able to issue a CONDSTORE enabling command.

Example: C: A142 SELECT INBOX (CONDSTORE)
S: * 172 EXISTS
S: * 1 RECENT
S: * OK [UNSEEN 12] Message 12 is first unseen
S: * OK [UIDVALIDITY 3857529045] UIDs valid
S: * OK [UIDNEXT 4392] Predicted next UID
S: * FLAGS (\Answered \Flagged \Deleted \Seen \Draft)
S: * OK [PERMANENTFLAGS (\Deleted \Seen *)] Limited

```
S: * OK [HIGHESTMODSEQ 20010715194045007]
S: A142 OK [READ-WRITE] SELECT completed, CONDSTORE is now
enabled
```

4. Formal Syntax

The following syntax specification uses the Augmented Backus-Naur Form (ABNF) notation as specified in [\[ABNF\]](#).

Non-terminals referenced but not defined below are as defined by [\[IMAP4\]](#).

Except as noted otherwise, all alphabetic characters are case-insensitive. The use of upper or lower case characters to define token strings is for editorial clarity only. Implementations MUST accept these strings in a case-insensitive fashion.

```
capability          =/ "CONDSTORE" / "SORT=MODSEQ"

status              = "STATUS" SP mailbox SP
                    "(" status-att-req *(SP status-att-req) ")"
                    ;; redefine STATUS command syntax defined in \[IMAP4\]

status-att-req      = status-att / "HIGHESTMODSEQ"

```

5. Security Considerations

It is believed that the Conditional STORE extension doesn't raise any new security concerns that are not already discussed in [[IMAP4](#)].

7. IANA Considerations

IMAP4 capabilities are registered by publishing a standards track or IESG approved experimental RFC. The registry is currently located at:

<http://www.iana.org/assignments/imap4-capabilities>

This document constitutes registration of the CONDSTORE and SORT=MODSEQ

IMAP capabilities.

8. Acknowledgments

Some text was borrowed from "IMAP ANNOTATE Extension" by Randall Gellens and Cyrus Daboo, and "ACAP -- Application Configuration Access Protocol" by Chris Newman and John Myers.

Many thanks to Randall Gellens for his comments on how CONDSTORE should interact with ANNOTATE extension and for thorough review of the document.

Authors also acknowledge the feedback provided by Cyrus Daboo, Larry Greenfield, Chris Newman, Harrie Hazewinkel, Arnt Gulbrandsen, Timo Sirainen and Mark Crispin.

Appendix A. Open Issues and Change History

Note that this appendix will be removed before publication.

0.1. Change History

Changes from [draft-ietf-imapext-condstore-02](#)

1. Added FETCH modifiers.
2. Added example for using ANNOTATE with UNCHANGEDSINCE STORE modifier.
3. Added a new requirement to send HIGHESTMODSEQ response code when implicit enabling is used.
4. Fixed syntax in an example in [section 3.2](#).

Changes from [draft-ietf-imapext-condstore-01](#)

1. Fixed missing \\ in one example.
2. Added explanatory comment that search-key modifications apply at least to SEARCH and SORT command.
3. Don't require from a conditional store operation to be atomic accross message set, updated text and examples.
4. Added SORT=MODSEQ extension and reworked text in the Introduction section.
5. Added Conditional STORE example based on suggestions from [RFC 2180](#).
6. Removed the paragraph about DOS attack from the Security considerations section, as it doesn't apply anymore.
7. Updated entry-name ABNF.
8. Added an optional CONDSTORE parameter to SELECT/EXAMINE.

Changes from [draft-ietf-imapext-condstore-00](#)

1. Dropped "/message" prefix in entry names as per decision in San Francisco.
2. Fixed ABNF for SEARCH and SORT untagged responses.
3. Changed "private" to "priv" to be consistent with ANNOTATE.
4. MODIFIED response code is now returned in OK response, not NO.
5. Added NOMODSEQ response code.

Changes from [draft-melnikov-imap-condstore-09](#):

1. Some text clarifications based on suggestions by Harrie Hazewinkel
2. Added paragraph about mailbox locking and DOS when conditional STORE operation is performed on a large mailbox.
3. Fixed syntax of <entry-name> to match the ANNOTATE extention.
4. Added sentence that a system flag MUST always be considered existent, when UNCHANGEDSINCE 0 is used. Is this a good idea?
5. Clarified client behavior upon receipt of MODIFIED response code.
6. Updated ABNF to clarify where 0 is allowed as mod-sequence and where it is not.
7. Got rid of MODSEQ response code and return this data in the untagged SEARCH/SORT responses.
8. Updated RFC number for the IMAP4rev1 document.

Changes from -08 to -09:

1. Added an extended example about reporting regular (non-conditional) flag changes to other sessions.
2. Simplified FETCH MODSEQ syntax by removing per-metadata requests and responses.

Changes from -07 to -08:

1. Added note saying the change to UIDVALIDITY also invalidates HIGHESTMODSEQ.
2. Fixed several bugs in ABNF for STATUS and STORE commands.

Changes from -06 to -07:

1. Added clarification that when a server does command reordering, the second

completed operation gets the higher mod sequence.

2. Renamed annotation type specifier "both" to "all" as per suggestion from Minneapolis meeting.
3. Removed PERFLAGMODSEQ capability, as it doesn't buy anything: a

client

has to work with both types of servers (i.e. servers that support per message per flag modseqs and servers that support only per message modseqs) anyway.

4. Per flag mod-sequences are optional for a server to return. Updated syntax.

5. Allow MODSEQ response code only as a result of SEARCH/SORT as suggested

by John Myers. MODSEQ response code is not allowed after FETCH or STORE.

Changes from -05 to -06:

1. Replaced "/message/flags/system" with "/message/flags" to match ANNOTATE draft.
2. Extended FETCH/SEARCH/SORT syntax to allow for specifying whether an operation should be performed on a shared or a private annotation (or both).
3. Corrected some examples.

Changes from -04 to -05:

1. Added support for SORT extension.
2. Multiple language/spelling fixes by Randall Gellens.

Changes from -03 to -04:

1. Added text saying that MODSEQ fetch data items cause server to include MODSEQ data response in all subsequent unsolicited FETCH responses.
2. Added "authors address" section.

Changes from -02 to -03:

1. Changed MODTIME untagged response to MODTIME response code.
2. Added MODTIME response code to the tagged OK response for SEARCH. Updated examples accordingly.
3. Changed rule for sending untagged FETCH response as a result of STORE when .SILENT prefix is used. If .SILENT prefix is used, server doesn't have to send untagged FETCH response, because MODTIME response code already contains modtime.
4. Renamed MODTIME to MODSEQ to make sure there is no confusion between mod-sequence and ACAP modtime.
5. Minor ABNF changes.
6. Minor language corrections.

Changes from -01 to -02:

1. Added MODTIME data item to STATUS command.
2. Added OK untagged response to SELECT/EXAMINE.
3. Clarified that MODIFIED response code contains list of UIDs for conditional UID STORE and message set for STORE.

4. Added per-message modtime.
5. Added PERFLAGMODTIME capability.
6. Fixed several bugs in examples.
7. Added more comments to ABNF.

Changes from -00 to -01:

1. Refreshed the list of Open Issues.
2. Changed "attr-name" to "entry-name", because modtime applies to entry, not attribute.
3. Added MODTIME untagged response.
4. Cleaned up ABNF.
5. Added "Acknowledgments" section.
6. Fixed some spelling mistakes.
