Internet Engineering Task Force INTERNET DRAFT November-2001 Jamie Jason Intel Corporation Lee Rafalow IBM Eric Vyncke Cisco Systems

IPsec Configuration Policy Model <u>draft-ietf-ipsp-config-policy-model-04.txt</u>

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of <u>Section 10 of RFC2026</u>. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/lid-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

Abstract

This document presents an object-oriented model of IPsec policy designed to:

- o facilitate agreement about the content and semantics of IPsec policy
- enable derivations of task-specific representations of IPsec policy such as storage schema, distribution representations, and policy specification languages used to configure IPsecenabled endpoints

The schema described in this document models the IKE phase one parameters as described in [IKE] and the IKE phase two parameters for the IPsec Domain of Interpretation as described in [COMP, ESP, AH, DOI]. It is based upon the core policy classes as defined in the Policy Core Information Model (PCIM) [PCIM] and on the Policy Core Information Model Extensions (PCIME).

[Page 6]

1. Introduction

Internet Protocol security (IPsec) policy may assume a variety of forms as it travels from storage to distribution point to decision point. At each step, it needs to be represented in a way that is convenient for the current task. For example, the policy could exist as, but is not limited to:

- a Lightweight Directory Access Protocol (LDAP) [LDAP] schema in a directory
- o an on-the-wire representation over a transport protocol like the Common Object Policy Service (COPS) [<u>COPS</u>, <u>COPSPR</u>]
- a text-based policy specification language suitable for editing by an administrator
- o an Extensible Markup Language (XML) document

Each of these task-specific representations should be derived from a canonical representation that precisely specifies the content and semantics of the IPsec policy. The purpose of this document is to abstract IPsec policy into a task-independent representation that is not constrained by any particular task-dependent representation.

This document is organized as follows:

- <u>Section 2</u> provides a quick introduction to the Unified Modeling Language (UML) graphical notation conventions used in this document.
- <u>Section 3</u> provides the inheritance hierarchy that describes where the IPsec policy classes fit into the policy class hierarchy already defined by the Policy Core Information Model (PCIM) and Policy Core Information Model Extensions (PCIMe).
- o Sections <u>4</u> through <u>8</u> describes the class that make up the IPsec policy model.
- o <u>Section 9</u> presents the implementation requirements for the classes in the model (i.e., the MUST/MAY/SHOULD status).

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [KEYWORDS].

2. UML Conventions

For this document, a UML static class diagram was chosen as the canonical representation for the IPsec policy model. The reason behind this decision is that UML provides a graphical, task-independent way to model systems. A treatise on the graphical

notation used in UML is beyond the scope of this paper. However, given the use of ASCII drawing for UML static class diagrams, a description of the notational conventions used in this document is in order:

Jason, et al

Expires May-2002

[Page 7]

Internet Draft IPsec Configuration Policy Model November 2001

- Boxes represent classes, with class names in brackets ([]) representing an abstract class.
- A line that terminates with an arrow (<, >, ^, v) denotes inheritance. The arrow always points to the parent class. Inheritance can also be called generalization or specialization (depending upon the reference point). A base class is a generalization of a derived class, and a derived class is a specialization of a base class.
- Associations are used to model a relationship between two classes. Classes that share an association are connected using a line. A special kind of association is also used: an aggregation. An aggregation models a whole-part relationship between two classes. Associations, and therefore aggregations, can also be modeled as classes.
- o A line that begins with an "o" denotes aggregation. Aggregation denotes containment in which the contained class and the containing class have independent lifetimes.
- Next to a line representing an association appears a cardinality. Cardinalities indicate the constraints on the number of object instances in a set of relationships. Every association instance has a single set of references. The cardinality indicates the number of instances that may refer to a given object instance. The cardinality may be:

 a range in the form "lower bound..upper bound" indicating the minimum and maximum number of objects.

- a number that indicates the exact number of objects.

- an asterisk indicating any number of objects, including zero. Using an asterisk is shorthand for 0..n.

- the letter n indicating from 1 to many. Using the letter n is shorthand for 1..n.

 A class that has an association may have a "w" next to the line representing the association. This is called a weak association and is discussed in [PCIM].

It should be noted that the UML static class diagram presented is a conceptual view of IPsec policy designed to aid in understanding. It does not necessarily get translated class for class into another representation. For example, an LDAP implementation may flatten out the representation to fewer classes (because of the inefficiency of following references).

<u>3</u>. IPsec Policy Model Inheritance Hierarchy

Like PCIM and PCIMe from which it is derived, the IPsec Configuration Policy Model derives from and uses classes defined in the DMTF [DMTF] Common Information Model (CIM). The following tree represents the inheritance hierarchy for the IPsec policy model classes and how they fit into PCIM, PCIMe and the other DMTF models (see Appendices for descriptions of classes that are not being introduced as part of IPsec model). CIM classes that are not used as a superclass from which to derive new classes but are only referenced are not included this inheritance hierarchy, but can be

Internet Draft IPsec Configuration Policy Model November 2001

<u>4</u>. Policy Classes

The IPsec policy classes represent the set of policies that are contained on a system.

+----+

- (a) PolicySetComponent ([PCIMe])
- (b) IPsecPolicyForEndpoint
- (c) IPsecPolicyForSystem

Jason, et al Expires May-2002

[Page 13]

- (d) RuleForIKENegotiation
- (e) RuleForIPsecNegotiation
- (f) PolicyRuleValidityPeriod ([PCIM])
- (g) SAConditionInRule
- (h) PolicyActionInSARule
- (i) PolicyActionInPolicyAction ([PCIMe])

An IPsecPolicyGroup represents the set of policies that are used on an interface. This IPsecPolicyGroup SHOULD be associated either directly with the IPProtocolEndpoint class instance that represents the interface (via the IPsecPolicyForEndpoint association) or indirectly (via the IPsecPolicyForSystem association) associated with the System that hosts the interface.

The IKE and IPsec rules are used to build or to negotiate the IPsec SADB. The IPsec rules represent the Security Policy Database. The SADB itself is not modeled by this document.

The rules usage can be described as (see also <u>section 6</u> about actions):

- o an egress unprotected packet will first be checked against the IPsec rules. If a match is found, the SADB will be checked. If there is no corresponding IPsec SA in the SADB and if IKE negotiation is required by the IPsec rule, the corresponding IKE rules will be used. The negotiated or preconfigured SA will then be installed in the SADB.
- o An ingress unprotected packet will first be checked against the IPsec rules. If a match is found, the SADB will be checked for a corresponding IPsec SA. If there is no corresponding IPsec SA and a preconfigured SA exists, this preconfigured SA will be installed in the IPsec SADB. This behavior should only apply to bypass and discard actions.
- o An ingress protected packet will first be checked against the IPsec rules. If a match is found, the SADB will be checked for a corresponding IPsec SA. If there is no corresponding IPsec SA and a preconfigured SA exists, this preconfigured SA will be installed in the IPsec SADB.
- o An ingress IKE negotiation packet, which is not part of an existing IKE SA, will be checked against the IKE rules. The negotiated SA will then be installed in the SADB.

<u>4.1</u>. The Class IPsecPolicyGroup

The class IPsecPolicyGroup serves as a container of either other IPsecPolicyGroups or a set of IKERules and a set of IPsecRules. The class definition for IPsecPolicyGroup is as follows: NAME IPsecPolicyGroup DESCRIPTION Either a set of IPsecPolicyGroups or a set of IKERules and a set of IPsecRules. DERIVED FROM PolicyGroup (see [PCIM] & [PCIMe]) ABSTRACT FALSE

PROPERTIES PolicyGroupName (from PolicyGroup)

PolicyDescisionStrategy (from PolicySet)

NOTE: for derivations of the schema that are used for policy distribution to an IPsec device (for example, COPS-PR), the server may follow all of PolicySetComponent associations and create one policy group which is simply a set of all of the IKE rules and a set of all of the IPsec rules. See the section on the PolicySetComponent aggregation for information on merging multiple IPsecPolicyGroups.

4.2. The Class SARule

The class SARule serves as a base class for IKERule and IPsecRule. Even though the class is concrete, it MUST not be instantiated. It defines a common connection point for associations to conditions and actions for both types of rules. Through its derivation from PolicyRule, an SARule (and therefore IKERule and IPsecRule) also has the PolicyRuleValidityPeriod association.

Each valid IpsecPolicyGroup MUST contain SARules that each have a unique associated priority number in PolicySetComponent.Priority. The class definition for SARule is as follows:

| NAME | SARule |
|--------------|---|
| DESCRIPTION | A base class for IKERule and IPsecRule. |
| DERIVED FROM | PolicyRule (see [<u>PCIM]</u> & [PCIMe]) |
| ABSTRACT | FALSE |
| PROPERTIES | PolicyRuleName (from PolicyRule) |
| | Enabled (from PolicyRule) |
| | ConditionListType (from PolicyRule) |
| | RuleUsage (from PolicyRule) |
| | Mandatory (from PolicyRule) |
| | SequencedActions (from PolicyRule) |
| | ExecutionStrategy (from PolicyRule) |
| | PolicyRoles (from PolicyRule) |
| | PolicyDecisionStrategy (from PolicySet) |
| | LimitNegotiation |
| | |

<u>4.2.1</u>. The Properties PolicyRuleName, Enabled, ConditionListType, RuleUsage, Mandatory, SequencedActions, PolicyRoles, and PolicyDecisionStrategy

For a description of these properties, see [PCIM] and [PCIME].

In SARule subclass instances:

- if the property Mandatory exists, it MUST be set to "true"
- if the property SequencedActions exists, it MUST be set to

"mandatory"

- the property PolicyRoles is not used in the device-level model

- if the property PolicyDecisionStrategy exists, it must be set to "FirstMatching"

Jason, et al

Expires May-2002

[Page 15]

<u>4.2.2</u> The Property ExecutionStrategy

The ExecutionStrategy properties in the PolicyRule subclasses (and in the CompoundPolicyAction class) determine the behavior of the contained actions. It defines the strategy to be used in executing the sequenced actions aggregated by a rule or a compound action. In the case of actions within a rule, the PolicyActionInSARule aggregation is used to collect the actions into an ordered set; in the case of a compound action, the PolicyActionInPolicyAction aggregation is used to collect the actions into an ordered subset.

There are three execution strategies: do until success, do all and do until failure.

"Do Until Success" causes the execution of actions according to the ActionOrder property in the aggregation instances until a successful execution of a single action. These actions may be evaluated to determine if they are appropriate to execute rather than blindly trying each of the actions until one succeeds. For an initiator, they are tried in the ActionOrder until the list is exhausted or one completes successfully. For example, an IKE initiator may have several IKEActions for the same SACondition. The initiator will try all IKEActions in the order defined by ActionOrder. I.e. it will possibly try several phase 1 negotiations possibly with different modes (main mode then aggressive mode) and/or with possibly multiple IKE peers. For a responder, when there is more than one action in the rule with "do until success" condition clause this provides alternative actions depending on the received proposals. For example, the same IKERule may be used to handle aggressive mode and main mode negotiations with different actions. The responder uses the first appropriate action in the list of actions.

"Do All" causes the execution all of the actions in aggregated set according to their defined order. The execution continues regardless of failures.

"Do Until Failure" causes the execution of all actions according to predefined order until the first failure in execution of an action instance.

For example, in a nested SAs case the actions of an initiator's rule might be structured as:

IPsecRule.ExecutionStrategy='Do All'
|
+---1--- IPsecTunnelAction // set up SA from host to gateway
|
+---2--- IPsecTransportAction // set up SA from host through

Another example, showing a rule with fallback actions might be structured as:

Jason, et alExpires May-2002[Page 16]

```
IPsecRule.ExecutionStrategy='Do Until Success'
|
+---6--- IPsecTransportAction // negotiate SA with peer
|
+---9--- IPsecBypassAction // but if you must, allow in the clear
```

The CompoundPolicyAction class (See [PCIME]) may be used in constructing the actions of IKE and IPsec rules when those rules specify both multiple actions and fallback actions. The ExecutionStrategy property in CompoundPolicyAction is used in conjunction with that in the PolicyRule.

For example, in nesting SAs with a fallback security gateway, the actions of a rule might be structured as:

IPsecRule.ExecutionStrategy='Do All'
+---1--- CompoundPolicyAction.ExecutionStrategy='Do Until Success'
| | |
+---1--- IPsecTunnelAction // set up SA from host to
| | // gateway1
| |
+---2--- IPsecTunnelAction // or set up SA to gateway2
|
+---2--- IPsecTransportAction // then set up SA from host
// through tunnel to remote
// host

In the case of "Do All", a couple of actions can be executed successfully before a subsequent action fails. In this case, some IKE or IPsec actions may have resulted in SA creation. Even if the net effect of the aggregated actions is failure, those created SA MAY be kept or MAY be deleted.

In the case of "Do All", the IPsec selectors to be used during IPsec SA negotiation are:

for the last IPsecAction of the aggregation (i.e. usually the innermost IPsec SA): this is the combination of the IPHeadersFilter class and of the Granularity property of the IpsecAction;

for all other IPsecActions of the aggregation: the selector is the source IP address being the local IP address and the destination IP address being the PeerGateway IP address of the following IPsecAction of the "Do All" aggregation. NB: the granularity is IP address to IP address.

If the above behavior is not desirable, the alternative is to define

several SARules one for each IPsec SA to be built. This will allow the definition of specific IPsec selectors for all IpsecActions.

<u>4.2.3</u> The Property LimitNegotiation

Jason, et alExpires May-2002[Page 17]

The property LimitNegotiation is used as part of processing either an IKE or an IPsec rule.

Before proceeding with a phase 1 negotiation, this property is checked to determine if the negotiation role of the rule matches that defined for the negotiation being undertaken (e.g., Initiator, Responder, or Both). If this check fails (e.g. the current role is IKE responder while the rule specifies IKE initiator), then the IKE negotiation is stopped. Note that this only applies to new IKE phase 1 negotiations and has no effect on either renegotiation or refresh operations with peers for which an established SA already exists.

Before proceeding with a phase 2 negotiation, the LimitNegotiation property of the IPsecRule is first checked to determine if the negotiation role indicated for the rule matches that of the current negotiation (Initiator, Responder, or Either). Note that this limit applies only to new phase 2 negotiations. It is ignored when an attempt is made to refresh an expiring SA (either side can initiate a refresh operation). The IKE system can determine that the negotiation is a refresh operation by checking to see if the selector information matches that of an existing SA. If LimitNegotiation does not match and the selector corresponds to a new SA, the negotiation is stopped.

The property is defined as follows:

| NAME | LimitNegotiation |
|-------------|--|
| DESCRIPTION | Limits the role to be undertaken during negotiation. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - initiator-only |
| | 2 - responder-only |
| | 3 - both |

4.3. The Class IKERule

The class IKERule associates Conditions and Actions for IKE phase 1 negotiations. The class definition for IKERule is as follows:

| NAME | IKERule |
|--------------|---|
| DESCRIPTION | Associates Conditions and Actions for IKE phase 1 |
| | negotiations. |
| DERIVED FROM | SARule |
| ABSTRACT | FALSE |
| PROPERTIES | same as SARule, plus |
| | IdentityContexts |

<u>4.3.1</u>. The Property IdentityContexts

The IKE service of a security endpoint may have multiple identities for use in different situations. The combination of the interface (represented by the IPProtocolEndpoint), the identity type (as

Jason, et al

Expires May-2002

[Page 18]

Internet Draft IPsec Configuration Policy Model November 2001

specified in the IKEAction) and the IdentityContexts specifies a unique identity.

The IdentityContexts property specifies the context to select the relevant IKE identity to be used during the further IKEAction. A context may be a VPN name or other identifier for selecting the appropriate identity for use on the protected IPProtocolEndpoint.

IdentityContexts is an array of strings. The multiple values in the array are ORed together in evaluating the IdentityContexts. Each value in the array may be the composition of multiple context names. So, a single value may be a single context name (e.g., "CompanyXVPN") or it may be combination of contexts. When an array value is a composition, the individual values are ANDed together for evaluation purposes and the syntax is:

```
<ContextName>[&&<ContextName>]*
```

where the individual context names appear in alphabetical order (according to the collating sequence for UCS-2). So, for example, the values "CompanyXVPN", "CompanyYVPN&&TopSecret", "CompanyZVPN&&Confidential" means that, for the appropriate IPProtocolEndpoint and IdentityType, the contexts are matched if the identity specifies "CompanyXVPN" or "CompanyYVPN&&TopSecret" or "CompanyZVPN&&Confidential".

The property is defined as follows:

| NAME | IdentityContexts |
|-------------|--|
| DESCRIPTION | Specifies the context in which to select the IKE |
| | identity. |
| SYNTAX | string array |

4.4. The Class IPsecRule

The class IPsecRule associates Conditions and Actions for IKE phase 2 negotiations for the IPsec DOI. The class definition for IPsecRule is as follows:

IPsecRule NAME DESCRIPTION Associates Conditions and Actions for IKE phase 2 negotiations for the IPsec DOI. DERIVED FROM SARule ABSTRACT FALSE PROPERTIES same as SARule

4.6. The Association Class IPsecPolicyForEndpoint

The class IPsecPolicyForEndpoint associates an IPsecPolicyGroup with

a specific network interface. If an IPProtocolEndpoint of a system does not have an IPsecPolicyForEndpoint-associated IPsecPolicyGroup, then the IPsecPolicyForSystem associated IPsecPolicyGroup is used

Jason, et al

Expires May-2002

[Page 19]

```
Internet Draft IPsec Configuration Policy Model November 2001
for that endpoint. The class definition for IPsecPolicyForEndpoint
is as follows:
NAME IPsecPolicyForEndpoint
DESCRIPTION Associates a policy group to a network interface.
DERIVED FROM Dependency (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Antecedent[ref IPProtocolEndpoint[0..n]]
Dependent[ref IPsecPolicyGroup[0..1]]
```

4.6.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to an IPProtocolEndpoint instance. The [0..n] cardinality indicates that an IPsecPolicyGroup instance may be associated with zero or more IPProtocolEndpoint instances.

4.6.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IPsecPolicyGroup instance. The [0..1] cardinality indicates that an IPProtocolEndpoint instance may have an association to at most one IPsecPolicyGroup instance.

4.7. The Association Class IPsecPolicyForSystem

The class IPsecPolicyForSystem associates an IPsecPolicyGroup with a specific system. If an IPProtocolEndpoint of a system does not have an IPsecPolicyForEndpoint-associated IPsecPolicyGroup, then the IPsecPolicyForSystem associated IPsecPolicyGroup is used for that endpoint. The class definition for IPsecPolicyForSystem is as follows:

| NAME | IPsecPolicyForSystem |
|--------------|--|
| DESCRIPTION | Default policy group for a system. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent[ref System[0n]] |
| | <pre>Dependent[ref IPsecPolicyGroup[01]]</pre> |

4.7.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a System instance. The [0..n] cardinality indicates that an IPsecPolicyGroup instance may have an association to zero or more System instances.

4.7.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IPsecPolicyGroup instance. The [0..1] cardinality indicates that a System instance may have an association to at most one IPsecPolicyGroup instance.

Jason, et alExpires May-2002[Page 20]

<u>4.8</u>. The Aggregation Class RuleForIKENegotiation

The class RuleForIKENegotiation associates an IKERule with the IPsecPolicyGroup that contains it. The class definition for RuleForIKENegotiation is as follows:

NAME RuleForIKENegotiation
DESCRIPTION Associates an IKERule with the IPsecPolicyGroup that
contains it.
DERIVED FROM PolicySetComponent (see [PCIME])
ABSTRACT FALSE
PROPERTIES Priority (from PolicySetComponent)
GroupComponent [ref IPsecPolicyGroup [1..1]]
PartComponent [ref IKERule [0..n]]

<u>4.8.1</u>. The Property Priority

For a description of this property, see [PCIME].

4.8.2. The Reference GroupComponent

The property GroupComponent is inherited from PolicyRuleInPolicyGroup and is overridden to refer to an IPsecPolicyGroup instance. The [1..1] cardinality indicates that an IKERule instance may be contained in one and only one IPsecPolicyGroup instance (i.e., IKERules are not shared across IPsecPolicyGroups).

4.8.3. The Reference PartComponent

The property PartComponent is inherited from PolicyRuleInPolicyGroup and is overridden to refer to an IKERule instance. The [0..n] cardinality indicates that an IPsecPolicyGroup instance may contain zero or more IKERule instances.

<u>4.9</u>. The Aggregation Class RuleForIPsecNegotiation

The class RuleForIPsecNegotiation associates an IPsecRule with the IPsecPolicyGroup that contains it. The class definition for RuleForIPsecNegotiation is as follows:

| NAME | RuleForIPsecNegotiation |
|--------------|--|
| DESCRIPTION | Associates an IPsecRule with the IPsecPolicyGroup that |
| | contains it. |
| DERIVED FROM | PolicySetComponent (see [<u>PCIME</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Priority (from PolicySetComponent) |
| | GroupComponent [ref IPsecPolicyGroup [11]] |

<u>4.9.1</u>. The Property Priority

Jason, et alExpires May-2002[Page 21]

For a description of this property, see [PCIME].

4.9.2. The Reference GroupComponent

The property GroupComponent is inherited from PolicyRuleInPolicyGroup and is overridden to refer to an IPsecPolicyGroup instance. The [1..1] cardinality indicates that an IPsecRule instance may be contained in only one IPsecPolicyGroup instance (i.e., IPsecRules are not shared across IPsecPolicyGroups).

<u>4.9.3</u>. The Reference PartComponent

The property PartComponent is inherited from PolicyRuleInPolicyGroup and is overridden to refer to an IPsecRule instance. The [0..n] cardinality indicates that an IPsecPolicyGroup instance may contain zero or more IPsecRules instance.

4.10. The Aggregation Class SAConditionInRule

The class SAConditionInRule associates an SARule with the SACondition instance(s) that trigger(s) it. The class definition for SAConditionInRule is as follows:

| NAME | SAConditionInRule |
|--------------|---|
| DESCRIPTION | Associates an SARule with the SACondition instance(s) |
| | that trigger(s) it. |
| DERIVED FROM | PolicyConditionInPolicyRule (see [<u>PCIM</u>] & [PCIMe]) |
| ABSTRACT | FALSE |
| PROPERTIES | GroupNumber (from PolicyConditionInPolicyRule) |
| | ConditionNegated (from PolicyConditionInPolicyRule) |
| | GroupComponent [ref SARule [0n]] |
| | PartComponent [ref SACondition [1n]] |
| | |

4.10.1. The Properties GroupNumber and ConditionNegated

For a description of these properties, see [PCIM].

4.10.2. The Reference GroupComponent

The property GroupComponent is inherited from PolicyConditionInPolicyRule and is overridden to refer to an SARule instance. The [0...] cardinality indicates that an SACondition instance may be contained in zero or more SARule instances.

4.10.3. The Reference PartComponent

The property PartComponent is inherited from PolicyConditionInPolicyRule and is overridden to refer to an SACondition instance. The [1..n] cardinality indicates that an SARule instance MUST contain at least one SACondition instance.

<u>4.11</u>. The Aggregation Class PolicyActionInSARule

Jason, et alExpires May-2002[Page 22]

The PolicyActionInSARule class associates an SARule with one or more PolicyAction instances. In all cases where an SARule is being used, the contained actions MUST be either subclasses of SAAction or instances of CompoundPolicyAction. For an IKERule, the contained actions MUST be related to phase 1 processing, i.e., IKEAction or IKERejectAction. Similarly, for an IPsecRule, contained actions MUST be related to phase 2 or preconfigured SA processing, e.g., IPsecTransportAction, IPsecBypassAction, etc. The class definition for PolicyActionInSARule is as follows:

| NAME | PolicyActionInSARule |
|--------------|--|
| DESCRIPTION | Associates an SARule with its PolicyAction(s). |
| DERIVED FROM | <pre>PolicyActionInPolicyRule (see [PCIM] & [PCIMe])</pre> |
| ABSTRACT | FALSE |
| PROPERTIES | GroupComponent [ref SARule [0n]] |
| | PartComponent [ref PolicyAction [1n]] |
| | ActionOrder (from PolicyActionInPolicyRule) |

4.11.1. The Reference GroupComponent

The property GroupComponent is inherited from PolicyActionInPolicyRule and is overridden to refer to an SARule instance. The [0..n] cardinality indicates that an SAAction instance may be contained in zero or more SARule instances.

4.11.2. The Reference PartComponent

The property PartComponent is inherited from PolicyActionInPolicyRule and is overridden to refer to an SAAction or CompoundPolicyAction instance. The [1..n] cardinality indicates that an SARule instance MUST contain at least one SAAction or CompoundPolicyAction instance.

4.11.3. The Property ActionOrder

The property ActionOrder is inherited from the superclass PolicyActionInPolicyRule. It specifies the relative position of this PolicyAction in the sequence of actions associated with a PolicyRule. The ActionOrder MUST be unique so as to provide a deterministic order. In addition, the actions in an SARule are executed as follows. See <u>section 4.2.2</u> ExecutionStrategy for a discussion on the use of the ActionOrder property.

The property is defined as follows:

| NAME | ActionOrder | |
|-------------|---|--------------|
| DESCRIPTION | Specifies the order of actions. | |
| SYNTAX | unsigned 16-bit integer | |
| VALUE | Any value between 1 and 2^16-1 inclusive. | Lower values |

have higher precedence (i.e., 1 is the highest precedence). The merging order of two SAActions with the same precedence is undefined.

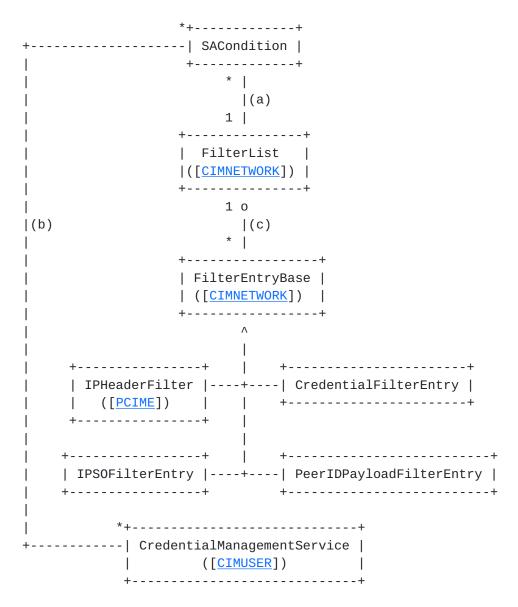

Jason, et al

Expires May-2002

[Page 23]

5. Condition and Filter Classes

The IPsec condition and filter classes are used to build the "if" part of the IKE and IPsec rules.

- (a) FilterOfSACondition
- (b) AcceptCredentialsFrom
- (c) EntriesInFilterList (see [CIMNETWORK])

5.1. The Class SACondition

The class SACondition defines the conditions of rules for IKE and IPsec negotiations. Conditions are associated with policy rules via the SAConditionInRule aggregation. It is used as an anchor point to

associate various types of filters with policy rules via the FilterOfSACondition association. It also defines whether Credentials can be accepted for a particular policy rule via the AcceptCredentialsFrom association.

Jason, et al Expires May-2002

[Page 24]

Associated objects represent components of the condition that may or may not apply at a given rule evaluation. For example, an AcceptCredentialsFrom evaluation is only performed when a credential is available to be evaluated against the list of trusted credential management services. Similarly, a PeerIDPayloadFilterEntry may only be evaluated when an IDPayload value is available to compared with the filter. Condition components that do not have corresponding values with which to evaluate are evaluated as TRUE unless the protocol has completed without providing the required information.

The class definition for SACondition is as follows:

NAME SACondition
DESCRIPTION Defines the preconditions for IKE and IPsec
negotiations.
DERIVED FROM PolicyCondition (see [PCIM])
ABSTRACT FALSE
PROPERTIES PolicyConditionName (from PolicyCondition)

5.2. The Class IPHeaderFilter

The class IPHeaderFilter is defined in [PCIMe] with the following note:

 to specify 5-tuple filters that are to apply symmetrically (i.e., matches traffic in both directions of the same flow between the two peers), the Direction property of the FilterList should be set to "Mirrored".

<u>5.3</u>. The Class CredentialFilterEntry

The class CredentialFilterEntry defines an equivalence class that match credentials of IKE peers. Each CredentialFilterEntry includes a MatchFieldName that is interpreted according to the CredentialManagementService(s) associated with the SACondition (AcceptCredentialsFrom).

These credentials can be X.509 certificates, Kerberos tickets, or other types of credentials obtained during the Phase 1 exchange.

The class definition for CredentialFilterEntry is as follows:

NAME CredentialFilterEntry DESCRIPTION Specifies a match filter based on the IKE credentials. DERIVED FROM FilterEntryBase (see [CIMNETWORK]) ABSTRACT FALSE PROPERTIES Name (from FilterEntryBase) ISNegated (from FilterEntryBase) MatchFieldName MatchFieldValue CredentialType

<u>5.3.1</u>. The Property MatchFieldName

Jason, et al

Expires May-2002

[Page 25]

The property MatchFieldName specifies the sub-part of the credential to match against MatchFieldValue. The property is defined as follows:

NAME MatchFieldName DESCRIPTION Specifies which sub-part of the credential to match. SYNTAX string VALUE

<u>5.3.2</u>. The Property MatchFieldValue

The property MatchFieldValue specifies the value to compare with the MatchFieldName in a credential to determine if the credential matches this filter entry. The property is defined as follows:

| NAME | MatchFieldValue |
|-------------|--|
| DESCRIPTION | Specifies the value to be matched by the |
| | MatchFieldName. |
| SYNTAX | string |
| VALUE | NB: If the CredentialFilterEntry corresponds to a |
| | DistinguishedName, this value in the CIM class is |
| | represented by an ordinary string value. However, an |
| | implementation must convert this string to a DER- |
| | encoded string before matching against the values |
| | extracted from credentials at runtime. |

<u>5.3.3</u>. The Property CredentialType

The property CredentialType specifies the particular type of credential that is being matched. The property is defined as follows:

| NAME | CredentialType |
|-------------|--------------------------------------|
| DESCRIPTION | Defines the type of IKE credentials. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - X.509 Certificate |
| | 2 - Kerberos Ticket |

5.4. The Class IPSOFilterEntry

The class IPSOFilterEntry is used to match traffic based on the IP Security Options header values (ClassificationLevel and ProtectionAuthority) as defined in <u>RFC1108</u>. This type of filter entry is used to adjust the IPsec encryption level according to the IPSO classification of the traffic (e.g., secret, confidential, restricted, etc. The class definition for IPSOFilterEntry is as follows: NAME IPSOFilterEntry DESCRIPTION Specifies the a match filter based on IP Security Options. DERIVED FROM FilterEntryBase (see [CIMNETWORK])

Jason, et alExpires May-2002[Page 26]

ABSTRACT FALSE Name (from FilterEntryBase) PROPERTIES IsNegated (from FilterEntryBase) MatchConditionType MatchConditionValue

5.4.1. The Property MatchConditionType

The property MatchConditionType specifies the IPSO header field that will be matched (e.g., traffic classification level or protection authority). The property is defined as follows:

| NAME | MatchConditionType |
|-------------|--|
| DESCRIPTION | Specifies the IPSO header field to be matched. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - ClassificationLevel |
| | 2 - ProtectionAuthority |

<u>5.4.2</u>. The Property MatchConditionValue

The property MatchConditionValue specifies the value of the IPSO header field to be matched against. The property is defined as follows:

| NAME | MatchConditionValue |
|-------------|---|
| DESCRIPTION | Specifies the value of the IPSO header field to be matched against. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | For ClassificationLevel, the values are: |
| | 61 - TopSecret |
| | 90 - Secret |
| | 150 - Confidential |
| | 171 - Unclassified |
| | For ProtectionAuthority, the values are: |
| | 0 - GENSER |
| | 1 - SIOP-ESI |
| | 2 - SCI |
| | 3 - NSA |
| | 4 - DOE |

5.5. The Class PeerIDPayloadFilterEntry

The class PeerIDPayloadFilterEntry defines filters used to match ID payload values from the IKE protocol exchange. PeerIDPayloadFilterEntry permits the specification of certain ID payload values such as "*@company.com" or "193.190.125.0/24".

Obviously this filter applies only to IKERules when acting as a responder. Moreover, this filter can be applied immediately in the case of aggressive mode but its application is to be delayed in the case of main mode. The class definition for PeerIDPayloadFilterEntry is as follows:

Jason, et al

Expires May-2002

[Page 27]

| NAME | PeerIDPayloadFilterEntry |
|--------------|---|
| DESCRIPTION | Specifies a match filter based on IKE identity. |
| DERIVED FROM | FilterEntryBase (see [<u>CIMNETWORK</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Name (from FilterEntryBase) |
| | IsNegated (from FilterEntryBase) |
| | MatchIdentityType |
| | MatchIdentityValue |

<u>5.5.1</u>. The Property MatchIdentityType

The property MatchIdentityType specifies the type of identity provided by the peer in the ID payload." The property is defined as follows:

| NAME | MatchIdentityType |
|-------------|--|
| DESCRIPTION | Specifies the ID payload type. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - IPv4 Address |
| | 2 - FQDN |
| | 3 - User FQDN |
| | 4 - IPv4 Subnet |
| | 5 - IPv6 Address |
| | 6 - IPv6 Subnet |
| | 7 - IPv4 Address Range |
| | 8 - IPv6 Address Range |
| | 9 - DER-Encoded ASN.1 X.500 Distinguished Name |
| | 10 - DER-Encoded ASN.1 X.500 GeneralName |
| | 11 - Key ID |
| | |

<u>5.5.2</u>. The Property MatchIdentityValue

The property MatchIdentityValue specifies the filter value for comparison with the ID payload, e.g., "*@company.com" The property is defined as follows:

| NAME | MatchIdentityValue |
|-------------|---|
| DESCRIPTION | Specifies the ID payload value. |
| SYNTAX | string |
| VALUE | NB: The syntax may need to be converted for comparison. |
| | If the PeerIDPayloadFilterEntry type is a |
| | DistinguishedName, the name in the MatchIdentityValue |
| | property is represented by an ordinary string value, |
| | but this value must be converted into a DER-encoded |
| | string before matching against the values extracted |
| | from IKE ID payloads at runtime. The same applies to |
| | IPv4 & IPv6 addresses. |

Wildcards can be used as well as the prefix notation for IPv4 addresses: - a MatchIdentityValue of "*@company.com" will match an ID payload of "JDOE@COMPANY.COM"

Jason, et al Expires May-2002

[Page 28]

- a MatchIdentityValue of "193.190.125.0/24" will match an ID payload of 193.190.125.10.

<u>5.6</u>. The Association Class FilterOfSACondition

The class FilterOfSACondition associates an SACondition with the filter specifications (FilterList) that make up the condition. The class definition for FilterOfSACondition is as follows:

NAME FilterOfSACondition
DESCRIPTION Associates a condition with the filter list that make
 up the individual condition elements.
DERIVED FROM Dependency (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Antecedent [ref FilterList[1..1]]
Dependent [ref SACondition[0..n]]

<u>5.6.1</u>. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a FilterList instance. The [1..1] cardinality indicates that an SACondition instance MUST be associated with one and only one FilterList instance.

5.6.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an SACondition instance. The [0..n] cardinality indicates that a FilterList instance may be associated with zero or more SAConditions instance.

5.7. The Association Class AcceptCredentialFrom

The class AcceptCredentialFrom specifies which credential management services (e.g., a CertificateAuthority or a Kerberos service) are to be trusted to certify peer credentials. This is used to validate that the credential being matched in the CredentialFilterEntry is a valid credential that has been supplied by an approved CredentialManagementService. If a CredentialManagementService is specified and a corresponding CredentialFilterEntry is used, but the credential supplied by the peer is not certified by that CredentialManagementService (or one of the CredentialManagementServices in its trust hierarchy), the CredentialFilterEntry is deemed not to match. If a credential is certified by a CredentialManagementService in the AcceptCredentialsFrom list of services but there is no CredentialFilterEntry, this is considered equivalent to a CredentialFilterEntry that matches all credentials from those services.

The class definition for AcceptCredentialFrom is as follows:

NAME AcceptCredentialFrom

Jason, et alExpires May-2002[Page 29]

| Internet Draft | IPsec Configuration Policy Model November 2001 |
|----------------|---|
| | |
| DESCRIPTION | Associates a condition with the credential management services to be trusted. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref CredentialManagementService[0n]] Dependent [ref SACondition[0n]] |

<u>5.7.1</u>. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a CredentialManagementService instance. The [0..n] cardinality indicates that an SACondition instance may be associated with zero or more CredentialManagementServices instance.

5.7.2. The Reference Dependent

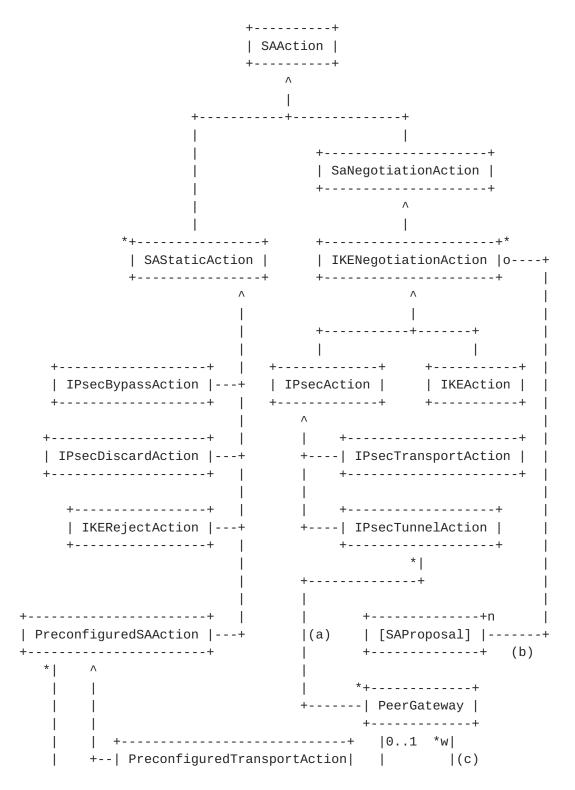

The property Dependent is inherited from Dependency and is overridden to refer to an SACondition instance. The [0..n] cardinality indicates that a CredentialManagementService instance may be associated with zero or more SAConditions instance.

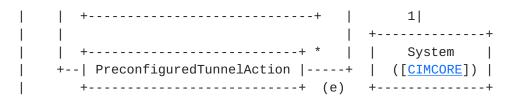

Jason, et al Expires May-2002

[Page 30]

6. Action Classes

The action classes are used to model the different actions an IPsec device may take when the evaluation of the associated condition results in a match.

Jason, et al

Expires May-2002

[Page 31]

6.1. The Class SAAction

The class SAAction is abstract and serves as the base class for IKE and IPsec actions. It is used for aggregating different types of actions to IKE and IPsec rules. The class definition for SAAction is as follows:

| NAME | SAAction |
|--------------|---|
| DESCRIPTION | The base class for IKE and IPsec actions. |
| DERIVED FROM | PolicyAction (see [<u>PCIM</u>]) |
| ABSTRACT | TRUE |
| PROPERTIES | PolicyActionName (from PolicyAction) |
| | DoActionLogging |
| | DoPacketLogging |

<u>6.1.1</u>. The Property DoActionLogging

The property DoActionLogging specifies whether a log message is to be generated when the action is performed. This applies for SANegotiationActions with the meaning of logging a message when the negotiation is attempted (with the success or failure result). This also applies for SAStaticAction only for PreconfiguredSAAction with the meaning of logging a message when the preconfigured SA is actually installed in the SADB. The property is defined as follows:

| NAME | DoActionLogging |
|-------------|---|
| DESCRIPTION | Specifies the whether to log when the action is |
| | performed. |
| SYNTAX | boolean |
| VALUE | true - a log message is to be generated when action is performed. |
| | false - no log message is to be generated when action |
| | is performed. |

6.1.2. The Property DoPacketLogging

The property DoPacketLogging specifies whether a log message is to be generated when the resulting security association is used to

process the packet. If the SANegotiationAction successfully executes and results in the creation of one or several security associations or if the PreconfiguredSAAction executes, the value of DoPacketLogging SHOULD be propagated to an optional field of SADB.

Jason, et al

Expires May-2002

[Page 32]

| Internet Draft | IPsec | Configuration | Policy Model | November | 2001 |
|----------------|-------|---------------|--------------|----------|------|
|----------------|-------|---------------|--------------|----------|------|

This optional field should be used to decide whether a log message is to be generated when the SA is used to process a packet. For SAStaticActions, a log message is to be generated when the IPsecBypassAction, IPsecDiscardAction, IKERejectAction are executed. The property is defined as follows:

| NAME | DoPacketLogging |
|-------------|--|
| DESCRIPTION | Specifies the whether to log when the resulting |
| | security association is used to process the packet. |
| SYNTAX | boolean |
| VALUE | true - a log message is to be generated when the resulting security association is used to process the |
| | packet. |
| | false - no log message is to be generated. |

<u>6.2</u>. The Class SAStaticAction

The class SAStaticAction is abstract and serves as the base class for IKE and IPsec actions that do not require any negotiation. The class definition for SAStaticAction is as follows:

| NAME | SAStaticAction |
|--------------|--|
| DESCRIPTION | The base class for IKE and IPsec actions that do not |
| | require any negotiation. |
| DERIVED FROM | SAAction |
| ABSTRACT | TRUE |
| PROPERTIES | LifetimeSeconds |

<u>6.2.1</u>. The Property LifetimeSeconds

The property LifetimeSeconds specifies how long the security association derived from this action should be used. The property is defined as follows:

| NAME | LifetimeSeconds |
|-------------|---|
| DESCRIPTION | Specifies the amount of time (in seconds) that a |
| | security association derived from this action should be |
| | used. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there is not a lifetime |
| | associated with this action (i.e., infinite lifetime). |
| | A non-zero value is typically used in conjunction with |
| | alternate SAActions performed when there is a |
| | negotiation failure of some sort. |

Note: if the referenced SAStaticAction object is a PreconfiguredSAAction associated to several SATransforms, then the actual lifetime of the preconfigured SA will be the smallest of the value of this LifetimeSeconds property and of the value of the MaxLifetimeSeconds property of the associated SATransform. Except if the value of this LifetimeSeconds property is zero, then there will be no lifetime associated to this SA.

Jason, et al

Expires May-2002

[Page 33]

It is expected that most SAStaticAction instances will have their LifetimeSeconds properties set to zero (meaning no expiration of the resulting SA).

<u>6.3</u>. The Class IPsecBypassAction

The class IPsecBypassAction is used when packets are allowed to be processed without applying IPsec encapsulation to them. This is the same as stating that packets are allowed to flow in the clear. The class definition for IPsecBypassAction is as follows:

NAME IPsecBypassAction DESCRIPTION Specifies that packets are to be allowed to pass in the clear. DERIVED FROM SAStaticAction ABSTRACT FALSE

6.4. The Class IPsecDiscardAction

The class IPsecDiscardAction is used when packets are to be discarded. This is the same as stating that packets are to be denied. The class definition for IPsecDiscardAction is as follows:

NAME IPsecDiscardAction DESCRIPTION Specifies that packets are to be discarded. DERIVED FROM SAStaticAction ABSTRACT FALSE

6.5. The Class IKERejectAction

The class IKERejectAction is used to prevent attempting an IKE negotiation with the peer(s). The main use of this class is to prevent some denial of service attacks when acting as IKE responder. It goes beyond a plain discard of UDP/500 IKE packets because the SACondition can be based on specific PeerIDPayloadFilterEntry (when aggressive mode is used). The class definition for IKERejectAction is as follows:

NAME IKERejectAction DESCRIPTION Specifies that an IKE negotiation should not even be attempted or continued. DERIVED FROM SAStaticAction ABSTRACT FALSE

<u>6.6</u>. The Class PreconfiguredSAAction

The class PreconfiguredSAAction is used to create a security association using preconfigured, hard-wired algorithms and keys.

Notes:

Jason, et al Expires May-2002

[Page 34]

- the SPI for a PreconfiguredSAAction is contained in the association, TransformOfPreconfiguredAction;
- the session key (if applicable) is contained in an instance of the class SharedSecret (see [CIMUSER]). The session key is stored in the property secret, the property protocol contains either "ESP-encrypt", "ESP-auth" or "AH", the property algorithm contains the algorithm used to protect the secret (can be "PLAINTEXT" if the IPsec entity has no secret storage), the value of property RemoteID is the concatenation of the remote IPsec peer IP address in dotted decimal, of the character "/", of "IN" (resp. "OUT") for inbound SA (resp. outbound SA), of the character "/" and of the hexadecimal representation of the SPI.

Although the class is concrete, it MUST not be instantiated. The class definition for PreconfiguredSAAction is as follows:

NAME PreconfiguredSAAction
DESCRIPTION Specifies preconfigured algorithm and keying
information for creation of a security association.
DERIVED FROM SAStaticAction
ABSTRACT FALSE
PROPERTIES LifetimeKilobytes

<u>6.6.1</u>. The Property LifetimeKilobytes

The property LifetimeKilobytes specifies a traffic limit in kilobytes that can be consumed before the SA is deleted.. The property is defined as follows:

| NAME | LifetimeKilobytes |
|-------------|--|
| DESCRIPTION | Specifies the SA lifetime in kilobytes. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there is not a lifetime |
| | associated with this action (i.e., infinite lifetime). |
| | A non-zero value is used to indicate that after this |
| | amount of kilobytes has been consumed the SA must be |
| | deleted from the SADB. |

Note: the actual lifetime of the preconfigured SA will be the smallest of the value of this LifetimeKilobytes property and of the value of the MaxLifetimeSeconds property of the associated SATransform. Except if the value of this LifetimeKilobytes property is zero, then there will be no lifetime associated with this action.

It is expected that most PreconfiguredSAAction instances will have their LifetimeKilobyte properties set to zero (meaning no expiration of the resulting SA).

<u>6.7</u>. The Class PreconfiguredTransportAction

Jason, et al Expires May-2002

[Page 35]

The class PreconfiguredTransportAction is used to create an IPsec transport-mode security association using preconfigured, hard-wired algorithms and keys. The class definition for PreconfiguredTransportAction is as follows:

NAME PreconfiguredTransportAction
DESCRIPTION Specifies preconfigured algorithm and keying
information for creation of an IPsec transport security
association.
DERIVED FROM PreconfiguredSAAction
ABSTRACT FALSE

6.8. The Class PreconfiguredTunnelAction

The class PreconfiguredTunnelAction is used to create an IPsec tunnel-mode security association using preconfigured, hard-wired algorithms and keys. The class definition for PreconfiguredSAAction is as follows:

| NAME | PreconfiguredTunnelAction |
|--------------|--|
| DESCRIPTION | Specifies preconfigured algorithm and keying |
| | information for creation of an IPsec tunnel-mode |
| | security association. |
| DERIVED FROM | PreconfiguredSAAction |
| ABSTRACT | FALSE |
| PROPERTIES | DFHandling |

<u>6.8.1</u>. The Property DFHandling

The property DFHandling specifies how the Don't Fragment bit of the internal IP header is to be handled during IPsec processing. The property is defined as follows:

| NAME | DFHandling |
|-------------|--|
| DESCRIPTION | Specifies the processing of the DF bit. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - Copy the DF bit from the internal IP header to the |
| | external IP header. |
| | 2 - Set the DF bit of the external IP header to 1. |
| | 3 - Clear the DF bit of the external IP header to 0. |
| | |

6.9. The Class SANegotiationAction

The class SANegotiationAction specifies an action requesting security policy negotiation.

This is an abstract class. Currently, only one security policy negotiation protocol action is subclassed from SANegotiationAction: the IKENegotiationAction class. It is nevertheless expected that other security policy negotiation protocols will exist and the negotiation actions of those new protocols would be modeled as a subclass of SANegotiationAction.

Jason, et al

Expires May-2002

[Page 36]

NAME SANegotiationAction DESCRIPTION Specifies a negotiation action . DERIVED FROM SAAction ABSTRACT TRUE

6.10. The Class IKENegotiationAction

The class IKENegotiationAction is abstract and serves as the base class for IKE and IPsec actions that result in a IKE negotiation. Although the class is concrete, is MUST not be instantiated. The class definition for IKENegotiationAction is as follows:

| NAME | IKENegotiationAction |
|--------------|--|
| DESCRIPTION | A base class for IKE and IPsec actions that specifies |
| | the parameters that are common for IKE phase 1 and IKE |
| | phase 2 IPsec DOI negotiations. |
| DERIVED FROM | SANegotiationAction |
| ABSTRACT | TRUE |
| PROPERTIES | MinLifetimeSeconds |
| | MinLifetimeKilobytes |
| | RefreshThresholdSeconds |
| | RefreshThresholdKilobytes |
| | IdleDurationSeconds |
| | |

6.10.1. The Property MinLifetimeSeconds

The property MinLifetimeSeconds specifies the minimum seconds lifetime that will be accepted from the peer. MinLifetimeSeconds is used to prevent certain denial of service attacks where the peer requests an arbitrarily low lifetime value, causing renegotiations with correspondingly expensive Diffie-Hellman operations. The property is defined as follows:

| NAME | MinLifetimeSeconds |
|-------------|---|
| DESCRIPTION | Specifies the minimum acceptable seconds lifetime. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there is no minimum |
| | value. A non-zero value specifies the minimum seconds |
| | lifetime. |

6.10.2. The Property MinLifetimeKilobytes

The property MinLifetimeKilobytes specifies the minimum kilobytes lifetime that will be accepted from the peer. MinLifetimeKilobytes is used to prevent certain denial of service attacks where the peer requests an arbitrarily low lifetime value, causing renegotiations with correspondingly expensive Diffie-Hellman operations. Note that there has been considerable debate regarding the usefulness of applying kilobyte lifetimes to IKE phase 1 security associations, so it is likely that this property will only apply to the sub-class IPsecAction. The property is defined as follows:

NAME MinLifetimeKilobytes

Jason, et alExpires May-2002[Page 37]

| Internet Draft IPsec | Configuration | Policy Model | November 2001 |
|----------------------|---------------|--------------|---------------|
|----------------------|---------------|--------------|---------------|

DESCRIPTION Specifies the minimum acceptable kilobytes lifetime. SYNTAX unsigned 32-bit integer VALUE A value of zero indicates that there is no minimum value. A non-zero value specifies the minimum kilobytes lifetime.

6.10.3. The Property RefreshThresholdSeconds

The property RefreshThresholdSeconds specifies what percentage of the seconds lifetime can expire before IKE should attempt to renegotiate the security association. A random value may be added to the calculated threshold (percentage x seconds lifetime) to reduce the chance of both peers attempting to renegotiate at the same time. The property is defined as follows:

| NAME | RefreshThresholdSeconds |
|-------------|--|
| DESCRIPTION | Specifies the percentage of seconds lifetime that has |
| | expired before the security association is |
| | renegotiated. |
| SYNTAX | unsigned 8-bit integer |
| VALUE | A value between 1 and 100 representing a percentage. A |
| | value of 100 indicates that the security association |
| | should not be renegotiated until the seconds lifetime |
| | has been reached. |

6.10.4. The Property RefreshThresholdKilobytes

The property RefreshThresholdKilobytes specifies what percentage of the kilobyte lifetime can expire before IKE should attempt to renegotiate the IPsec security association. A random value may be added to the calculated threshold (percentage x kilobyte lifetime) to reduce the chance of both peers attempting to renegotiate at the same time. Note, that as with the property MinLifetimeKilobytes, this property is probably only relevant to IPsecAction sub-classes. The property is defined as follows:

| NAME | RefreshThresholdKilobytes |
|-------------|--|
| DESCRIPTION | Specifies the percentage of kilobyte lifetime that has |
| | expired before the IPsec security association is |
| | renegotiated. |
| SYNTAX | unsigned 8-bit integer |
| VALUE | A value between 1 and 100 representing a percentage. A |
| | value of 100 indicates that the IPsec security |
| | association should not be renegotiated until the |
| | kilobyte lifetime has been reached. |

6.10.5. The Property IdleDurationSeconds

The property IdleDurationSeconds specifies how many seconds a security association may remain idle (i.e., no traffic protected using the security association) before it is deleted. The property is defined as follows:

Jason, et al

Expires May-2002

[Page 38]

Internet Draft IPsec Configuration Policy Model November 2001

NAME IdleDurationSeconds
DESCRIPTION Specifies how long, in seconds, a security association may remain unused before it is deleted.
SYNTAX unsigned 32-bit integer
VALUE A value of zero indicates that idle detection should not be used for the security association (only the seconds and kilobyte lifetimes will be used). Any non-zero value indicates the number of seconds the security association may remain unused.

6.11. The Class IPsecAction

The class IPsecAction serves as the base class for IPsec transport and tunnel actions. It specifies the parameters used for an IKE phase 2 IPsec DOI negotiation. Although the class is concrete, is MUST not be instantiated. The class definition for IPsecAction is as follows:

| NAME | IPsecAction |
|--------------|---|
| DESCRIPTION | A base class for IPsec transport and tunnel actions |
| | that specifies the parameters for IKE phase 2 IPsec DOI |
| | negotiations. |
| DERIVED FROM | IKENegotiationAction |
| ABSTRACT | FALSE |
| PROPERTIES | UsePFS |
| | UseIKEGroup |
| | GroupId |
| | Granularity |
| | VendorID |
| | |

6.11.1. The Property UsePFS

The property UsePFS specifies whether or not perfect forward secrecy should be used when refreshing keys. The property is defined as follows:

| NAME | UsePFS |
|-------------|---|
| DESCRIPTION | Specifies the whether or not to use PFS when refreshing |
| | keys. |
| SYNTAX | boolean |
| VALUE | A value of true indicates that PFS should be used. A |
| | value of false indicates that PFS should not be used. |

6.11.2. The Property UseIKEGroup

The property UseIKEGroup specifies whether or not phase 2 should use the same key exchange group as was used in phase 1. UseIKEGroup is ignored if UsePFS is false. The property is defined as follows: NAME UseIKEGroup

Jason, et al Expires May-2002

[Page 39]

| Internet Draft I | IPsec | Configuration | Policy | Model | November | 2001 |
|------------------|-------|---------------|--------|-------|----------|------|
|------------------|-------|---------------|--------|-------|----------|------|

- DESCRIPTION Specifies whether or not to use the same GroupId for phase 2 as was used in phase 1. If UsePFS is false, then UseIKEGroup is ignored. SYNTAX boolean
- VALUE A value of true indicates that the phase 2 GroupId should be the same as phase 1. A value of false indicates that the property GroupId will contain the key exchange group to use for phase 2.

6.11.3. The Property GroupId

The property GroupId specifies the key exchange group to use for phase 2. GroupId is ignored if (1) the property UsePFS is false, or (2) the property UsePFS is true and the property UseIKEGroup is true. If the GroupID number is from the vendor-specific range (32768-65535), the property VendorID qualifies the group number. The property is defined as follows:

| NAME | GroupId |
|-------------|---|
| DESCRIPTION | Specifies the key exchange group to use for phase 2 |
| | when the property UsePFS is true and the property |
| | UseIKEGroup is false. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Consult [<u>IKE</u>] for valid values. |

<u>6.11.4</u>. The Property Granularity

The property Granularity specifies how the selector for the security association should be derived from the traffic that triggered the negotiation. The property is defined as follows:

| NAME | Granularity |
|-------------|--|
| DESCRIPTION | Specifies the how the proposed selector for the |
| | security association will be created. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - subnet: the source and destination subnet masks of |
| | the filter entry are used. |
| | 2 - address: only the source and destination IP |
| | addresses of the triggering packet are used. |
| | 3 - protocol: the source and destination IP addresses |
| | and the IP protocol of the triggering packet are used. |
| | 4 - port: the source and destination IP addresses and |
| | the IP protocol and the source and destination layer 4 |
| | ports of the triggering packet are used. |

<u>6.11.5</u>. The Property VendorID

The property VendorID is used together with the property GroupID (when it is in the vendor-specific range) to identify the key

exchange group. VendorID is ignored unless UsePFS is true and UseIKEGroup is false and GroupID is in the vendor-specific range (32768-65535). The property is defined as follows:

Jason, et al

Expires May-2002

[Page 40]

NAME VendorID DESCRIPTION Specifies the IKE Vendor ID. SYNTAX string

6.12. The Class IPsecTransportAction

The class IPsecTransportAction is a subclass of IPsecAction that is used to specify use of an IPsec transport-mode security association. The class definition for IPsecTransportAction is as follows:

| NAME | IPsecTransportAction |
|--------------|---|
| DESCRIPTION | Specifies that an IPsec transport-mode security |
| | association should be negotiated. |
| DERIVED FROM | IPsecAction |
| ABSTRACT | FALSE |

6.13. The Class IPsecTunnelAction

The class IPsecTunnelAction is a subclass of IPsecAction that is used to specify use of an IPsec tunnel-mode security association. The class definition for IPsecTunnelAction is as follows:

| NAME | IPsecTunnelAction |
|--------------|--|
| DESCRIPTION | Specifies that an IPsec tunnel-mode security |
| | association should be negotiated. |
| DERIVED FROM | IPsecAction |
| ABSTRACT | FALSE |
| PROPERTIES | DFHandling |

6.13.1. The Property DFHandling

The property DFHandling specifies how the tunnel should manage the Don't Fragment (DF) bit. The property is defined as follows:

| NAME | DFHandling |
|-------------|--|
| DESCRIPTION | Specifies how to process the DF bit. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - Copy the DF bit from the internal IP header to the |
| | external IP header. |
| | 2 - Set the DF bit of the external IP header to 1. |
| | 3 - Clear the DF bit of the external IP header to 0. |
| | |

6.14. The Class IKEAction

The class IKEAction specifies the parameters that are to be used for IKE phase 1 negotiation. The class definition for IKEAction is as follows:

NAME IKEAction

DESCRIPTION Specifies the IKE phase 1 negotiation parameters. DERIVED FROM IKENegotiationAction ABSTRACT FALSE

Jason, et al Expires May-2002

[Page 41]

RefreshThresholdDerivedKeys PROPERTIES ExchangeMode UseIKEIdentityType VendorID AggressiveModeGroupId

6.14.1. The Property RefreshThresholdDerivedKeys

The property RefreshThresholdDerivedKeys specifies what percentage of the derived key limit (see the LifetimeDerivedKeys property of IKEProposal) can expire before IKE should attempt to renegotiate the IKE phase 1 security association. A random value may be added to the calculated threshold (percentage x derived key limit) to reduce the chance of both peers attempting to renegotiate at the same time. The property is defined as follows:

| NAME | RefreshThresholdKilobytes |
|-------------|--|
| DESCRIPTION | Specifies the percentage of derived key limit that has |
| | expired before the IKE phase 1 security association is |
| | renegotiated. |
| SYNTAX | unsigned 8-bit integer |
| VALUE | A value between 1 and 100 representing a percentage. A |
| | value of 100 indicates that the IKE phase 1 security |
| | association should not be renegotiated until the |
| | derived key limit has been reached. |

6.14.2. The Property ExchangeMode

The property ExchangeMode specifies which IKE mode should be used for IKE phase 1 negotiations. The property is defined as follows:

| NAME | ExchangeMode |
|-------------|---|
| DESCRIPTION | Specifies the IKE negotiation mode for phase 1. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - base mode |
| | 2 - main mode |
| | 4 - aggressive mode |

6.14.3. The Property UseIKEIdentityType

The property UseIKEIdentityType specifies what IKE identity type should be used when negotiating with the peer. This information is used in conjunction with the IKE identities available on the system and the IdentityContexts of the matching IKERule. The property is defined as follows:

NAME UseIKEIdentityType DESCRIPTION Specifies the IKE identity to use during negotiation. unsigned 16-bit integer SYNTAX

- VALUE 1 IPv4 Address
 - 2 FQDN
 - 3 User FQDN
 - 4 IPv4 Subnet

Jason, et al

Expires May-2002

[Page 42]

| 5 - IPv6 Address |
|--|
| 6 - IPv6 Subnet |
| 7 - IPv4 Address Range |
| 8 - IPv6 Address Range |
| 9 - DER-Encoded ASN.1 X.500 Distinguished Name |
| 10 - DER-Encoded ASN.1 X.500 GeneralName |

11 - Key ID

6.14.4. The Property VendorID

The property VendorID specifies the value to be used in the Vendor ID payload. The property is defined as follows:

NAME VendorID
DESCRIPTION Vendor ID Payload.
SYNTAX string
VALUE A value of NULL means that Vendor ID payload will be
neither generated nor accepted. A non-NULL value means
that a Vendor ID payload will be generated (when acting
as an initiator) or is expected (when acting as a
responder).

6.14.5. The Property AggressiveModeGroupId

The property AggressiveModeGroupId specifies which group ID is to be used in the first packets of the phase 1 negotiation. This property is ignored unless the property ExchangeMode is set to 4 (aggressive mode). If the AggressiveModeGroupID number is from the vendorspecific range (32768-65535), the property VendorID qualifies the group number. The property is defined as follows:

NAME AggressiveModeGroupId DESCRIPTION Specifies the group ID to be used for aggressive mode. SYNTAX unsigned 16-bit integer

6.15. The Class PeerGateway

The class PeerGateway specifies the security gateway with which the IKE services negotiates. The class definition for PeerGateway is as follows:

NAME PeerGateway DESCRIPTION Specifies the security gateway with which to negotiate. DERIVED FROM LogicalElement (see [CIMCORE]) ABSTRACT FALSE PROPERTIES Name PeerIdentityType PeerIdentity

6.15.1. The Property Name

The property Name specifies a user-friendly name for this security gateway. The property is defined as follows:

Jason, et alExpires May-2002[Page 43]

| NAME | Name |
|-------------|--|
| DESCRIPTION | Specifies a user-friendly name for this security |
| | gateway. |
| SYNTAX | string |

<u>6.15.2</u>. The Property PeerIdentityType

The property PeerIdentityType specifies the IKE identity type of the security gateway. The property is defined as follows:

| NAME | PeerIdentityType |
|-------------|---|
| DESCRIPTION | Specifies the IKE identity type of the security |
| | gateway. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - IPv4 Address |
| | 2 - FQDN |
| | 3 - User FQDN |
| | 4 - IPv4 Subnet |
| | 5 - IPv6 Address |
| | 6 - IPv6 Subnet |
| | 7 - IPv4 Address Range |
| | 8 - IPv6 Address Range |
| | 9 - DER-Encoded ASN.1 X.500 Distinguished Name |
| | 10 - DER-Encoded ASN.1 X.500 GeneralName |
| | 11 - Key ID |

6.15.3. The Property PeerIdentity

The property PeerIdentity specifies the IKE identity value of the security gateway. A conversion may be needed between the PeerIdentity string representation and the real value used in the ID payload (e.g. IP address is to be converted from a dotted decimal string into 4 bytes). The property is defined as follows:

NAME PeerIdentity DESCRIPTION Specifies the IKE identity value of the security gateway. SYNTAX string

6.16. The Association Class PeerGatewayForTunnel

The class PeerGatewayForTunnel associates IPsecTunnelActions with an ordered list of PeerGateways. The class definition for PeerGatewayForTunnel is as follows:

NAME PeerGatewayForTunnel DESCRIPTION Associates IPsecTunnelActions with an ordered list of

PeerGateways. DERIVED FROM Dependency (see [CIMCORE]) ABSTRACT FALSE

Jason, et al Expires May-2002

[Page 44]

Antecedent [ref PeerGateway[0..n]] PROPERTIES Dependent [ref IPsecTunnelAction[0..n]] SequenceNumber

6.16.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a PeerGateway instance. The [0..n] cardinality indicates that there an IPsecTunnelAction instance may be associated with zero or more PeerGateway instances.

Note: the cardinality 0 has a specific meaning:

- when the IKE service acts as a responder, this means that the IKE service will accept phase 1 negotiation with any other security gateway;
- when the IKE service acts as an initiator, this means that the IKE service will use the destination IP address (of the IP packets which triggered the SARule) as the IP address of the peer IKE entity.

6.16.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IPsecTunnelAction instance. The [0...] cardinality indicates that a PeerGateway instance may be associated with zero or more IPsecTunnelAction instances.

6.16.3. The Property SequenceNumber

The property SequenceNumber specifies the ordering to be used when evaluating PeerGateway instances for a given IPsecTunnelAction. The property is defined as follows:

| NAME | SequenceNumber |
|-------------|---|
| DESCRIPTION | Specifies the order of evaluation for PeerGateways. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Lower values are evaluated first. |

6.17. The Aggregation Class ContainedProposal

The class ContainedProposal associates an ordered list of SAProposals with the IKENegotiationAction that aggregates it. If the referenced IKENegotiationAction object is an IKEAction, then the referenced SAProposal object(s) must be IKEProposal(s). If the referenced IKENegotiationAction object is an IPsecTransportAction or an IPsecTunnelAction, then the referenced SAProposal object(s) must be IPsecProposal(s). The class definition for ContainedProposal is as follows:

| NAME | ContainedProposal |
|-------------|---|
| DESCRIPTION | Associates an ordered list of SAProposals with an |
| | IKENegotiationAction. |

Jason, et al Expires May-2002 [Page 45]

DERIVED FROM PolicyComponent (see [PCIM]) ABSTRACT FALSE PROPERTIES GroupComponent[ref IKENegotiationAction[0..n]] PartComponent[ref SAProposal[1..n]] SequenceNumber

6.17.1. The Reference GroupComponent

 The property GroupComponent is inherited from PolicyComponent and is overridden to refer to an IKENegotiationAction instance. The [0..n] cardinality indicates that an SAProposal instance may be associated with zero or more IKENegotiationAction instances.

6.17.2. The Reference PartComponent

The property PartComponent is inherited from PolicyComponent and is overridden to refer to an SAProposal instance. The [1..n] cardinality indicates that an IKENegotiationAction instance MUST be associated with at least one SAProposal instance.

6.17.3. The Property SequenceNumber

The property SequenceNumber specifies the order of preference for the SAProposals. The property is defined as follows:

| NAME | SequenceNumber |
|-------------|---|
| DESCRIPTION | Specifies the preference order for the SAProposals. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Lower-valued proposals are preferred over proposals |
| | with higher values. For ContainedProposals that |
| | reference the same IKENegotiationAction, SequenceNumber |
| | values must be unique. |

<u>6.18</u>. The Association Class HostedPeerGatewayInformation

The class HostedPeerGatewayInformation weakly associates a PeerGateway with a System. The class definition for HostedPeerGatewayInformation is as follows:

NAME HostedPeerGatewayInformation DESCRIPTION Weakly associates a PeerGateway with a System. DERIVED FROM Dependency (see [CIMCORE]) ABSTRACT FALSE PROPERTIES Antecedent [ref System[1..1]] Dependent [ref PeerGateway[0..n] [weak]]

6.18.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a System instance. The [1..1] cardinality

Jason, et al

Expires May-2002

[Page 46]

indicates that a PeerGateway instance MUST be associated with one and only one System instance.

6.18.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to a PeerGateway instance. The [0..n] cardinality indicates that a System instance may be associated with zero or more PeerGateway instances.

6.19. The Association Class TransformOfPreconfiguredAction

The class TransformOfPreconfiguredAction associates a PreconfiguredSAAction with from two to six SATransforms that will be applied to the inbound and outbound traffic. The order of application of the SATransforms is implicitly defined in [IPSEC]. The class definition for TransformOfPreconfiguredAction is as follows:

| NAME | TransformOfPreconfiguredAction |
|--------------|---|
| DESCRIPTION | Associates a PreconfiguredSAAction with from one to |
| | three SATransforms. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent[ref SATransform[26]] |
| | <pre>Dependent[ref PreconfiguredSAAction[0n]]</pre> |
| | SPI |
| | Direction |

6.19.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to an SATransform instance. The [2..6] cardinality indicates that an PreconfiguredSAAction instance may be associated with from two to six SATransform instances.

6.19.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to a PreconfiguredSAAction instance. The [0...] cardinality indicates that an SATransform instance may be associated with zero or more PreconfiguredSAAction instances.

6.19.3. The Property SPI

The property SPI specifies the SPI to be used by the pre-configured action for the associated transform. The property is defined as follows:

| NAME | SPI |
|-------------|--|
| DESCRIPTION | Specifies the SPI to be used with the SATransform. |
| SYNTAX | unsigned 32-bit integer |

Jason, et al Expires May-2002 [Page 47]

<u>6.19.4</u>. The Property Direction

The property Direction specifies whether the SPI property is for inbound or for outbound traffic. The property is defined as follows:

| NAME | Direction |
|-------------|---|
| DESCRIPTION | Specifies whether the SA is for inbound or outbound |
| | traffic. |
| SYNTAX | unsigned 8-bit integer |
| VALUE | 1 - this SA is for inbound traffic |
| | 2 - this SA is for outbound traffic |

6.20 The Association Class PeerGatewayForPreconfiguredTunnel

The class PeerGatewayForPreconfiguredTunnel associates one or one PeerGateway with multiple PreconfiguredTunnelActions. The class definition for PeerGatewayForPreconfiguredTunnel is as follows:

| NAME | PeerGatewayForPreconfiguredTunnel |
|--------------|---|
| DESCRIPTION | Associates a PeerGateway with multiple |
| | PreconfiguredTunnelAction. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent[ref PeerGateway[01]] |
| | <pre>Dependent[ref PreconfiguredTunnelAction[0n]]</pre> |

<u>6.20.1</u>. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to an PeerGateway instance. The [0..1] cardinality indicates that an PreconfiguredTunnelAction instance may be associated with one PeerGteway instance.

6.20.2. The Reference Dependent

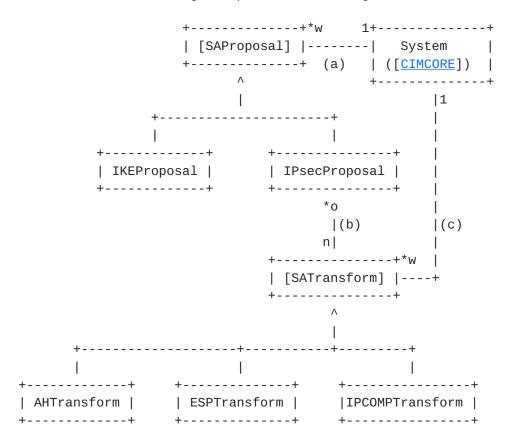

The property Dependent is inherited from Dependency and is overridden to refer to a PreconfiguredTunnelAction instance. The [0..n] cardinality indicates that an PeerGateway instance may be associated with zero or more PreconfiguredSAAction instances.

Jason, et al Expires May-2002

[Page 48]

7. Proposal and Transform Classes

The proposal and transform classes model the proposal settings an IPsec device will use during IKE phase 1 and 2 negotiations.

- (a) SAProposalInSystem
- (b) ContainedTransform
- (c) SATransformInSystem

<u>7.1</u>. The Abstract Class SAProposal

The abstract class SAProposal serves as the base class for the IKE and IPsec proposal classes. It specifies the parameters that are common to the two proposal types. The class definition for SAProposal is as follows:

NAME SAProposal DESCRIPTION Specifies the common proposal parameters for IKE and IPsec security association negotiation. DERIVED FROM Policy ([PCIM]) ABSTRACT TRUE PROPERTIES Name

<u>7.1.1</u>. The Property Name

The property Name specifies a user-friendly name for the SAProposal. The property is defined as follows:

NAME Name

Jason, et al

Expires May-2002

[Page 49]

DESCRIPTION Specifies a user-friendly name for this proposal. SYNTAX string

7.2. The Class IKEProposal

The class IKEProposal specifies the proposal parameters necessary to drive an IKE security association negotiation. The class definition for IKEProposal is as follows:

| NAME | IKEProposal |
|--------------|--|
| DESCRIPTION | Specifies the proposal parameters for IKE security |
| | association negotiation. |
| DERIVED FROM | SAProposal |
| ABSTRACT | FALSE |
| PROPERTIES | LifetimeDerivedKeys |
| | CipherAlgorithm |
| | HashAlgorithm |
| | PRFAlgorithm |
| | GroupId |
| | AuthenticationMethod |
| | MaxLifetimeSeconds |
| | MaxLifetimeKilobytes |
| | VendorID |

7.2.1. The Property LifetimeDerivedKeys

The property LifetimeDerivedKeys specifies the number of times that a phase 1 key will be used to derive a phase 2 key before the phase 1 security association needs renegotiated. Even though this is not a parameter that is sent in an IKE proposal, it is included in the proposal as the number of keys derived may be a result of the strength of the algorithms in the IKE proposal. The property is defined as follows:

| NAME | LifetimeDerivedKeys |
|-------------|---|
| DESCRIPTION | Specifies the number of phase 2 keys that can be |
| | derived from the phase 1 key. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there is no limit to the |
| | number of phase 2 keys that may be derived from the |
| | phase 1 key; instead the seconds and/or kilobytes |
| | lifetime will dictate the phase 1 rekeying. A non-zero |
| | value specifies the number of phase 2 keys that can be |
| | derived from the phase 1 key. |

7.2.2. The Property CipherAlgorithm

The property CipherAlgorithm specifies the proposed phase 1 security association encryption algorithm. The property is defined as

follows:

NAME CipherAlgorithm

Jason, et al Expires May-2002

[Page 50]

| Internet Draft IPsec | • Configuration | Policy Model | November 2001 |
|----------------------|-----------------|--------------|---------------|
|----------------------|-----------------|--------------|---------------|

DESCRIPTION Specifies the proposed encryption algorithm for the phase 1 security association. SYNTAX unsigned 16-bit integer VALUE Consult [IKE] for valid values.

7.2.3. The Property HashAlgorithm

The property HashAlgorithm specifies the proposed phase 1 security association hash algorithm. The property is defined as follows:

| NAME | HashAlgorithm |
|-------------|---|
| DESCRIPTION | Specifies the proposed hash algorithm for the phase 1 |
| | security association. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Consult [<u>IKE</u>] for valid values. |

7.2.4. The Property PRFAlgorithm

The property PRFAlgorithm specifies the proposed phase 1 security association pseudo-random function. The property is defined as follows:

| NAME | PRFAlgorithm |
|-------------|---|
| DESCRIPTION | Specifies the proposed pseudo-random function for the |
| | phase 1 security association. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Currently none defined. |

7.2.5. The Property GroupId

The property GroupId specifies the proposed phase 1 security association key exchange group. This property is ignored for all aggressive mode exchanges. If the GroupID number is from the vendor-specific range (32768-65535), the property VendorID qualifies the group number. The property is defined as follows:

| NAME | GroupId |
|-------------|---|
| DESCRIPTION | Specifies the proposed key exchange group for the phase |
| | 1 security association. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 0 - Not applicable: used for aggressive mode. Consult |
| | [<u>IKE</u>] for other valid values. |

7.2.6. The Property AuthenticationMethod

The property AuthenticationMethod specifies the proposed phase 1 authentication method. The property is defined as follows:

NAME AuthenticationMethod

| DESCRIPTION | Specifies the proposed authentication method for the |
|-------------|--|
| | phase 1 security association. |
| SYNTAX | unsigned 16-bit integer |
| | |

Jason, et al Expires May-2002 [Page 51]

Internet Draft IPsec Configuration Policy Model November 2001

VALUE 0 - a special value that indicates that this particular proposal should be repeated once for each authentication method that corresponds to the credentials installed on the machine. For example, if the system has a pre-shared key and a certificate, a proposal list could be constructed which includes a proposal that specifies pre-shared key and proposals for any of the public-key authentication methods. Consult [IKE] for valid values.

7.2.7. The Property MaxLifetimeSeconds

The property MaxLifetimeSeconds specifies the maximum amount of time, in seconds, to propose that a security association will remain valid after its creation. The property is defined as follows:

| NAME | MaxLifetimeSeconds |
|-------------|---|
| DESCRIPTION | Specifies the maximum amount of time to propose a |
| | security association remain valid. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that the default of 8 hours |
| | be used. A non-zero value indicates the maximum |
| | seconds lifetime. |

7.2.8. The Property MaxLifetimeKilobytes

The property MaxLifetimeKilobytes specifies the maximum kilobyte lifetime to propose that a security association will remain valid after its creation. The property is defined as follows:

| NAME | MaxLifetimeKilobytes |
|-------------|---|
| DESCRIPTION | Specifies the maximum kilobyte lifetime to propose a |
| | security association remain valid. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there should be no |
| | maximum kilobyte lifetime. A non-zero value specifies |
| | the desired kilobyte lifetime. |

7.2.9. The Property VendorID

The property VendorID further qualifies the key exchange group. The property is ignored unless the exchange is not in aggressive mode and the property GroupID is in the vendor-specific range. The property is defined as follows:

| NAME | VendorID |
|-------------|--|
| DESCRIPTION | Specifies the Vendor ID to further qualify the key |
| | exchange group. |
| SYNTAX | string |

<u>7.3</u>. The Class IPsecProposal

Jason, et al Expires May-2002

[Page 52]

The class IPsecProposal adds no new properties, but inherits proposal properties from SAProposal as well as aggregating the security association transforms necessary for building an IPsec proposal (see the aggregation class ContainedTransform). The class definition for IPsecProposal is as follows:

NAME IPsecProposal DESCRIPTION Specifies the proposal parameters for IPsec security association negotiation. DERIVED FROM SAProposal ABSTRACT FALSE

7.4. The Abstract Class SATransform

The abstract class SATransform serves as the base class for the IPsec transforms that can be used to compose an IPsec proposal or to be used as a pre-configured action. The class definition for SATransform is as follows:

| NAME | SATransform |
|-------------|--|
| DESCRIPTION | Base class for the different IPsec transforms. |
| ABSTRACT | TRUE |
| PROPERTIES | TransformName |
| | VendorID |
| | MaxLifetimeSeconds |
| | MaxLifetimeKilobytes |
| | |

7.4.1. The Property TransformName

The property TransformName specifies a user-friendly name for the SATransform. The property is defined as follows:

NAME TransformName DESCRIPTION Specifies a user-friendly name for this transform. SYNTAX string

7.4.2. The Property VendorID

The property VendorID specifies the vendor ID for vendor-defined transforms. The property is defined as follows:

| NAME | VendorID |
|-------------|--|
| DESCRIPTION | Specifies the vendor ID for vendor-defined transforms. |
| SYNTAX | string |
| VALUE | An empty VendorID string indicates that the transform |
| | is a standard one. |

7.4.3. The Property MaxLifetimeSeconds

The property MaxLifetimeSeconds specifies the maximum amount of time, in seconds, to propose that a security association will remain valid after its creation. The property is defined as follows:

Jason, et al

Expires May-2002

[Page 53]

| Internet Draft IPs | c Configuration | Policy Model | November 2001 |
|--------------------|-----------------|--------------|---------------|
|--------------------|-----------------|--------------|---------------|

| NAME | MaxLifetimeSeconds |
|-------------|---|
| DESCRIPTION | Specifies the maximum amount of time to propose a |
| | security association remain valid. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that the default of 8 hours |
| | be used. A non-zero value indicates the maximum |
| | seconds lifetime. |

7.4.4. The Property MaxLifetimeKilobytes

The property MaxLifetimeKilobytes specifies the maximum kilobyte lifetime to propose that a security association will remain valid after its creation. The property is defined as follows:

| NAME | MaxLifetimeKilobytes |
|-------------|---|
| DESCRIPTION | Specifies the maximum kilobyte lifetime to propose a |
| | security association remain valid. |
| SYNTAX | unsigned 32-bit integer |
| VALUE | A value of zero indicates that there should be no |
| | maximum kilobyte lifetime. A non-zero value specifies |
| | the desired kilobyte lifetime. |

7.5. The Class AHTransform

The class AHTransform specifies the AH algorithm to propose during IPsec security association negotiation. The class definition for AHTransform is as follows:

| NAME | AHTransform | | | |
|-------------|--|--|--|--|
| DESCRIPTION | Specifies the AH algorithm to propose. | | | |
| ABSTRACT | FALSE | | | |
| PROPERTIES | AHTransformId | | | |
| | UseReplayPrevention | | | |
| | ReplayPreventionWindowSize | | | |

<u>7.5.1</u>. The Property AHTransformId

The property AHTransformId specifies the transform ID of the AH algorithm to propose. The property is defined as follows:

NAMEAHTransformIdDESCRIPTIONSpecifies the transform ID of the AH algorithm.SYNTAXunsigned 16-bit integerVALUEConsult [DOI] for valid values.

<u>7.5.2</u>. The Property UseReplayPrevention

The property UseReplayPrevention specifies whether replay prevention detection is to be used. The property is defined as follows:

| NAME | UseReplayPrevention | | | | |
|-------------|---------------------|-------|--------|--------|------------|
| DESCRIPTION | Specifies wheth | er to | enable | replay | prevention |
| | detection. | | | | |

Jason, et al Expires May-2002 [Page 54]

| SYNTAX | boolean |
|--------|--|
| VALUE | true - replay prevention detection is enabled. |
| | false - replay prevention detection is disabled. |

7.5.3. The Property ReplayPreventionWindowSize

The property ReplayPreventionWindowSize specifies, in bits, the length of the sliding window used by the replay prevention detection mechanism. The value of this property is meaningless if UseReplayPrevention is false. It is assumed that the window size will be power of 2. The property is defined as follows:

| NAME | ReplayPreventionWindowSize |
|-------------|---|
| DESCRIPTION | Specifies the length of the window used by replay |
| | prevention detection mechanism. |
| SYNTAX | unsigned 32-bit integer |

<u>7.6</u>. The Class ESPTransform

The class ESPTransform specifies the ESP algorithms to propose during IPsec security association negotiation. The class definition for ESPTransform is as follows:

| NAME | ESPTransform |
|-------------|--|
| DESCRIPTION | Specifies the ESP algorithms to propose. |
| ABSTRACT | FALSE |
| PROPERTIES | IntegrityTransformId |
| | CipherTransformId |
| | CipherKeyLength |
| | CipherKeyRounds |
| | UseReplayPrevention |
| | ReplayPreventionWindowSize |

7.6.1. The Property IntegrityTransformId

The property IntegrityTransformId specifies the transform ID of the ESP integrity algorithm to propose. The property is defined as follows:

| NAME | IntegrityTransformId |
|-------------|---|
| DESCRIPTION | Specifies the transform ID of the ESP integrity |
| | algorithm. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Consult [DOI] for valid values. |

7.6.2. The Property CipherTransformId

The property CipherTransformId specifies the transform ID of the ESP encryption algorithm to propose. The property is defined as

follows:

NAME CipherTransformId

Jason, et al Expires May-2002

[Page 55]

DESCRIPTION Specifies the transform ID of the ESP encryption algorithm. SYNTAX unsigned 16-bit integer VALUE Consult [DOI] for valid values.

7.6.3. The Property CipherKeyLength

The property CipherKeyLength specifies, in bits, the key length for the ESP encryption algorithm. For encryption algorithms that use fixed-length keys, this value is ignored. The property is defined as follows:

NAME CipherKeyLength DESCRIPTION Specifies the ESP encryption key length in bits. SYNTAX unsigned 16-bit integer

7.6.4. The Property CipherKeyRounds

The property CipherKeyRounds specifies the number of key rounds for the ESP encryption algorithm. For encryption algorithms that use fixed number of key rounds, this value is ignored. The property is defined as follows:

| NAME | CipherKeyRounds |
|-------------|---|
| DESCRIPTION | Specifies the number of key rounds for the ESP |
| | encryption algorithm. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Currently, key rounds are not defined for any ESP |
| | encryption algorithms. |

<u>7.6.5</u>. The Property UseReplayPrevention

The property UseReplayPrevention specifies whether replay prevention detection is to be used. The property is defined as follows:

| NAME | UseReplayPrevention |
|-------------|--|
| DESCRIPTION | Specifies whether to enable replay prevention |
| | detection. |
| SYNTAX | boolean |
| VALUE | true - replay prevention detection is enabled. |
| | false - replay prevention detection is disabled. |

7.6.6. The Property ReplayPreventionWindowSize

The property ReplayPreventionWindowSize specifies, in bits, the length of the sliding window used by the replay prevention detection mechanism. The value of this property is meaningless if UseReplayPrevention is false. It is assumed that the window size will be power of 2. The property is defined as follows:

| NAME | ReplayPreventionWindowSize |
|-------------|---|
| DESCRIPTION | Specifies the length of the window used by replay |
| | prevention detection mechanism. |

| Jason, et al Expires May-2002 | [Page 56] |
|-------------------------------|-----------|
|-------------------------------|-----------|

Internet Draft IPsec Configuration Policy Model November 2001

SYNTAX unsigned 32-bit integer

7.7. The Class IPCOMPTransform

The class IPCOMPTransform specifies the IP compression (IPCOMP) algorithm to propose during IPsec security association negotiation. The class definition for IPCOMPTransform is as follows:

NAME IPCOMPTransform DESCRIPTION Specifies the IPCOMP algorithm to propose. ABSTRACT FALSE PROPERTIES Algorithm DictionarySize PrivateAlgorithm

7.7.1. The Property Algorithm

The property Algorithm specifies the transform ID of the IPCOMP compression algorithm to propose. The property is defined as follows:

| NAME | Algorithm |
|-------------|--|
| DESCRIPTION | Specifies the transform ID of the IPCOMP compression |
| | algorithm. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 1 - OUI: a vendor specific algorithm is used and |
| | specified in the property PrivateAlgorithm. Consult |
| | [<u>DOI</u>] for other valid values. |

7.7.2. The Property DictionarySize

The property DictionarySize specifies the log2 maximum size of the dictionary for the compression algorithm. For compression algorithms that have pre-defined dictionary sizes, this value is ignored. The property is defined as follows:

NAME DictionarySize DESCRIPTION Specifies the log2 maximum size of the dictionary. SYNTAX unsigned 16-bit integer

7.7.3. The Property PrivateAlgorithm

The property PrivateAlgorithm specifies a private vendor-specific compression algorithm. This value is only used when the property Algorithm is 1 (OUI). The property is defined as follows:

NAME PrivateAlgorithm DESCRIPTION Specifies a private vendor-specific compression algorithm.

SYNTAX unsigned 32-bit integer

7.8. The Association Class SAProposalInSystem

Jason, et al

Expires May-2002

[Page 57]

The class SAProposalInSystem weakly associates SAProposals with a System. The class definition for SAProposalInSystem is as follows:

| NAME | SAProposalInSystem |
|--------------|---|
| DESCRIPTION | Weakly associates SAProposals with a System. |
| DERIVED FROM | PolicyInSystem (see [<u>PCIM</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent[ref System [11]] |
| | <pre>Dependent[ref SAProposal[0n] [weak]]</pre> |

7.8.1. The Reference Antecedent

The property Antecedent is inherited from PolicyInSystem and is overridden to refer to a System instance. The [1..1] cardinality indicates that an SAProposal instance MUST be associated with one and only one System instance.

7.8.2. The Reference Dependent

The property Dependent is inherited from PolicyInSystem and is overridden to refer to an SAProposal instance. The [0...] cardinality indicates that a System instance may be associated with zero or more SAProposal instances.

7.9. The Aggregation Class ContainedTransform

The class ContainedTransform associates an IPsecProposal with the set of SATransforms that make up the proposal. If multiple transforms of the same type are in a proposal, then they are to be logically ORed and the order of preference is dictated by the SequenceNumber property. Sets of transforms of different types are logically ANDed. For example, if the ordered proposal list were

```
ESP = { (HMAC-MD5, 3DES), (HMAC-MD5, DES) }
AH = { MD5, SHA-1 }
```

then the one sending the proposal would want the other side to pick one from the ESP transform (preferably (HMAC-MD5, 3DES)) list AND one from the AH transform list (preferably MD5).

The class definition for ContainedTransform is as follows:

NAME ContainedTransform DESCRIPTION Associates an IPsecProposal with the set of SATransforms that make up the proposal. DERIVED FROM PolicyComponent (see [PCIM]) FALSE ABSTRACT GroupComponent[ref IPsecProposal[0..n]] PROPERTIES

PartComponent[ref SATransform[1..n]]
SequenceNumber

<u>7.9.1</u>. The Reference GroupComponent

Jason, et al

Expires May-2002

[Page 58]

The property GroupComponent is inherited from PolicyComponent and is overridden to refer to an IPsecProposal instance. The [0..n] cardinality indicates that an SATransform instance may be associated with zero or more IPsecProposal instances.

7.9.2. The Reference PartComponent

The property PartComponent is inherited from PolicyComponent and is overridden to refer to an SATransform instance. The [1..n] cardinality indicates that an IPsecProposal instance MUST be associated with at least one SATransform instance.

7.9.3. The Property SequenceNumber

The property SequenceNumber specifies the order of preference for the SATransforms of the same type. The property is defined as follows:

| NAME | SequenceNumber |
|-------------|--|
| DESCRIPTION | Specifies the preference order for the SATransforms of |
| | the same type. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | Lower-valued transforms are preferred over transforms |
| | of the same type with higher values. For |
| | ContainedTransforms that reference the same |
| | IPsecProposal, SequenceNumber values must be unique. |

7.10. The Association Class SATransformInSystem

The class SATransformInSystem weakly associates SATransforms with a System. The class definition for SATransformInSystem System is as follows:

| NAME | SATransformInSystem |
|--------------|--|
| DESCRIPTION | Weakly associates SATransforms with a System. |
| DERIVED FROM | PolicyInSystem (see [<u>PCIM</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent[ref System[11]] |
| | <pre>Dependent[ref SATransform[0n] [weak]]</pre> |

<u>7.10.1</u>. The Reference Antecedent

The property Antecedent is inherited from PolicyInSystem and is overridden to refer to a System instance. The [1..1] cardinality indicates that an SATransform instance MUST be associated with one and only one System instance.

<u>7.10.2</u>. The Reference Dependent

The property Dependent is inherited from PolicyInSystem and is overridden to refer to an SATransform instance. The [0..n]

Jason, et alExpires May-2002[Page 59]

cardinality indicates that a System instance may be associated with zero or more SATransform instances.

Jason, et al Expires May-2002

[Page 60]

+----+ +----+ System | | PeerIdentityEntry | ([<u>CIMCORE</u>]) | +----+ +----+ |*W 1| (a) (b) +---+ +--+ *W 1 O +----+ +----+ +----+ | PeerIdentityTable | | AutostartIKESetting | | PeerGateway | +----+ +----+ +----+ *| *| * | *| +-----+ |(d) +-----+ * * * (c) (e) *+---+* (f) +-----| IKEService |----+ |(h) (g) +---+ *| *| *0 0..1 +----+ +----+ | | AutostartIKEConfiguration | (i)| +----+ | IPProtocolEndpoint | ([<u>CIMNETWORK</u>]) | +----+ 0..1 |(j) +----+ |* *| +----+* (k) +-----+ +------++ | IKEIdentity |-----| Collection | | CredentialManagementService | +----+ 0..1| ([CIMCORE])| | ([CIMUSER]) | *| +----+ |(1)*| +----+ Credential | ([<u>CIMUSER</u>]) | +----+ (a) HostedPeerIdentityTable (b) PeerIdentityMember (c) IKEServicePeerGateway (d) IKEServicePeerIdentityTable (e) IKEAutostartSetting (f) AutostartIKESettingContext (g) IKEServiceForEndpoint (h) IKEAutostartConfiguration (i) IKEUsesCredentialManagementService (j) EndpointHasLocalIKEIdentity

8. IKE Service and Identity Classes

- (k) CollectionHasLocalIKEIdentity
- (1) IKEIdentitysCredential

This portion of the model contains additional information that is useful in applying the policy. The IKEService class MAY be used to

Jason, et al Expires May-2002 [Page 61]

represent the IKE negotiation function in a system. The IKEService uses the various tables that contain information about IKE peers as well as the configuration for specifying security associations that are started automatically. The information in the PeerGateway, PeerIdentityTable and related classes is necessary to completely specify the policies.

An interface (represented by an IPProtocolEndpoint) has an IKEService that provides the negotiation services for that interface. That service MAY also have a list of security associations for that are automatically started at the time the IKE service is initialized.

The IKEService also has a set of identities that it may use in negotiations with its peers. Those identities are associated with the interfaces (or collections of interfaces).

8.1. The Class IKEService

The class IKEService represents the IKE negotiation function. An instance of this service may provide that negotiation service for one or more interfaces (represented by the IPProtocolEndpoint class) of a System. There may be multiple instances of IKE services on a System but only one per interface. The class definition for IKEService is as follows:

NAME IKEService DESCRIPTION IKEService is used to represent the IKE negotiation function. DERIVED FROM Service (see [CIMCORE]) ABSTRACT FALSE

<u>8.2</u>. The Class PeerIdentityTable

The class PeerIdentityTable aggregates the table entries that provide mappings between identities and their addresses. The class definition for PeerIdentityTable is as follows:

NAME PeerIdentityTable
DESCRIPTION PeerIdentityTable aggregates PeerIdentityEntry
instances to provide a table of identity-address
mappings.
DERIVED FROM Collection (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Name

8.3.1. The Property Name

The property Name uniquely identifies the table. The property is

defined as follows:

NAME Name DESCRIPTION Name uniquely identifies the table.

Jason, et al Ex

Expires May-2002

[Page 62]

Internet Draft IPsec Configuration Policy Model November 2001

SYNTAX string

<u>8.3</u>. The Class PeerIdentityEntry

The class PeerIdentityEntry specifies the mapping between peer identity and their address. The class definition for PeerIdentityEntry is as follows:

| NAME | PeerIdentityEntry |
|--------------|---|
| DESCRIPTION | PeerIdentityEntry provides a mapping between a peer's |
| | identity and address. |
| DERIVED FROM | LogicalElement (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | PeerIdentity |
| | PeerIdentityType |
| | PeerAddress |
| | PeerAddressType |

8.3.1. The Property PeerIdentity

The property PeerIdentity contains a string encoding of the Identity payload for the IKE peer. The property is defined as follows:

NAME PeerIdentity DESCRIPTION The PeerIdentity is the ID payload of a peer. SYNTAX string

8.3.2. The Property PeerIdentityType

The property PeerIdentityType is an enumeration that specifies the type of the PeerIdentity. The property is defined as follows:

| NAME | PeerIdentityType |
|-------------|---|
| DESCRIPTION | PeerIdentityType is the type of the ID payload of a |
| | peer. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | The enumeration values are specified in [DOI] section |
| | 4.6.2.1. |

8.3.3. The Property PeerAddress

The property PeerAddress specifies the string representation of the IP address of the peer formatted according to the appropriate convention as defined in the PeerAddressType property (e.g., dotted decimal notation). The property is defined as follows:

NAME PeerAddress DESCRIPTION PeerAddress is the address of the peer with the ID payload. SYNTAXstringVALUEString representation of an IPv4 or IPv6 address.

<u>8.3.4</u>. The Property PeerAddressType

| Jason, et al | Expires May-2002 | [Page 63] |
|--------------|------------------|-----------|
| , | | |

The property PeerAddressType specifies the format of the PeerAddress property value. The property is defined as follows:

| NAME | PeerAddressType |
|-------------|--|
| DESCRIPTION | PeerAddressType is the type of address in PeerAddress. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 0 - Unknown |
| | 1 - IPv4 |
| | 2 - IPv6 |

8.4. The Class AutostartIKEConfiguration

The class AutostartIKEConfiguration groups AutostartIKESetting instances into configuration sets. When applied, the settings cause an IKE service to automatically start (negotiate or statically set as appropriate) the Security Associations. The class definition for AutostartIKEConfiguration is as follows:

NAMEAutostartIKEConfigurationDESCRIPTIONA configuration set of AutostartIKESetting instances to
be automatically started by the IKE service.DERIVED FROMSystemConfiguration (see [CIMCORE])ABSTRACTFALSE

8.5. The Class AutostartIKESetting

The class AutostartIKESetting is used to automatically initiate IKE negotiations with peers (or statically create an SA) as specified in the AutostartIKESetting properties. Appropriate actions are initiated according to the policy that matches the setting parameters. The class definition for AutostartIKESetting is as follows:

| NAME | AutostartIKESetting |
|--------------|---|
| DESCRIPTION | AutostartIKESetting is used to automatically initiate |
| | IKE negotiations with peers or statically create an SA. |
| DERIVED FROM | SystemSetting (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Phase10nly |
| | AddressType |
| | SourceAddress |
| | SourcePort |
| | DestinationAddress |
| | DestinationPort |
| | Protocol |

8.5.1. The Property Phase10nly

The property Phase1Only is used to limit the IKE negotiation to just setting up a phase 1 security association. When set to False, both phase 1 and 2 negotiations are initiated. The property is defined as follows:

Jason, et al

Expires May-2002

[Page 64]

| NAME | Phase10nly |
|-------------|---|
| DESCRIPTION | Used to indicate which security associations to attempt |
| | to establish (phase 1 only, or phase 1 and 2). |
| SYNTAX | boolean |
| VALUE | true - attempt to establish a phase 1 security |
| | association |
| | false - attempt to establish phase 1 and 2 security |
| | associations |

8.5.2. The Property AddressType

The property AddressType specifies type of the addresses in the SourceAddress and DestinationAddress properties. The property is defined as follows:

| NAME | AddressType |
|-------------|---|
| DESCRIPTION | AddressType is the type of address in SourceAddress and |
| | DestinationAddress properties. |
| SYNTAX | unsigned 16-bit integer |
| VALUE | 0 - Unknown |
| | 1 - IPv4 |
| | 2 - IPv6 |

8.5.3. The Property SourceAddress

The property SourceAddress specifies the dotted-decimal or colondecimal formatted IP address used as the source address in comparing with policy filter entries and used in any phase 2 negotiations. The property is defined as follows:

| NAME | SourceAddress |
|-------------|--|
| DESCRIPTION | The source address to compare with the filters to |
| | determine the appropriate policy rule. |
| SYNTAX | string |
| VALUE | dotted-decimal or colon-decimal formatted IP address |

8.5.4. The Property SourcePort

The property SourcePort specifies the port number used as the source port in comparing with policy filter entries and used in any phase 2 negotiations. The property is defined as follows:

| NAME | SourcePort |
|-------------|--|
| DESCRIPTION | The source port to compare with the filters to |
| | determine the appropriate policy rule. |
| SYNTAX | unsigned 16-bit integer |

<u>8.5.5</u>. The Property DestinationAddress

The property DestinationAddress specifies the dotted-decimal or colon-decimal formatted IP address used as the destination address

Jason, et al Expires May-2002

[Page 65]

| Internet Draft I | [Psec | Configuration | Policy | Model | November | 2001 |
|------------------|-------|---------------|--------|-------|----------|------|
|------------------|-------|---------------|--------|-------|----------|------|

in comparing with policy filter entries and used in any phase 2 negotiations. The property is defined as follows:

| NAME | DestinationAddress | | | |
|-------------|--|--|--|--|
| DESCRIPTION | The destination address to compare with the filters to | | | |
| | determine the appropriate policy rule. | | | |
| SYNTAX | string | | | |
| VALUE | dotted-decimal or colon-decimal formatted IP address | | | |

<u>8.5.6</u>. The Property DestinationPort

The property DestinationPort specifies the port number used as the destination port in comparing with policy filter entries and used in any phase 2 negotiations. The property is defined as follows:

| NAME | DestinationPort |
|-------------|---|
| DESCRIPTION | The destination port to compare with the filters to |
| | determine the appropriate policy rule. |
| SYNTAX | unsigned 16-bit integer |

<u>8.5.7</u>. The Property Protocol

The property Protocol specifies the protocol number used in comparing with policy filter entries and used in any phase 2 negotiations. The property is defined as follows:

| NAME | Protocol |
|-------------|---|
| DESCRIPTION | The protocol number used in comparing with policy |
| | filter entries. |
| SYNTAX | unsigned 8-bit integer |

8.6. The Class IKEIdentity

The class IKEIdentity is used to represent the identities that may be used for an IPProtocolEndpoint (or collection of IPProtocolEndpoints) to identify the IKE Service in IKE phase 1 negotiations. The policy IKEAction.UseIKEIdentityType specifies which type of the available identities to use in a negotiation exchange and the IKERule.IdentityContexts specifies the match values to be used, along with the local address, in selecting the appropriate identity for a negotiation. The ElementID property value (defined in the parent class, UsersAccess) should be that of either the IPProtocolEndpoint or Collection of endpoints as appropriate. The class definition for IKEIdentity is as follows:

NAME IKEIdentity DESCRIPTION IKEIdentity is used to represent the identities that may be used for an IPProtocolEndpoint (or collection of IPProtocolEndpoints) to identify the IKE Service in IKE

phase 1 negotiations. DERIVED FROM UsersAccess (see [CIMUSER]) ABSTRACT FALSE

Jason, et al Expires May-2002

[Page 66]

PROPERTIES IdentityType IdentityValue IdentityContexts

8.6.1. The Property IdentityType

The property IdentityType is an enumeration that specifies the type of the IdentityValue. The property is defined as follows:

NAME IdentityType DESCRIPTION IdentityType is the type of the IdentityValue. SYNTAX unsigned 8-bit integer VALUE The enumeration values are specified in [DOI] section 4.6.2.1.

8.6.2. The Property IdentityValue

The property Identity specifies Value contains a string encoding of the Identity payload. For IKEIdentity instances that are address types, the IdentityValue string value may be omitted and the associated IPProtocolEndpoint or appropriate member of the Collection of endpoints is used. The property is defined as follows:

| NAME | IdentityValue |
|-------------|---|
| DESCRIPTION | IdentityValue contains a string encoding of the |
| | Identity payload. |
| SYNTAX | string |

<u>8.6.3</u>. The Property IdentityContexts

The IdentityContexts property is used to constrain the use of IKEIdentity instances to match that specified in the IKERule.IdentityContexts. The IdentityContexts are formatted as policy roles and role combinations [PCIM] & [PCIMe]. Each value represents one context or context combination. Since this is a multi-valued property, more than one context or combination of contexts can be associated with a single IKEIdentity. Each value is a string of the form: <ContextName>[&&<ContextName>]* where the individual context names appear in alphabetical order (according to the collating sequence for UCS-2). If one or more values in the IKERule.IdentityContexts array match one or more IKEIdentity.IdentityContexts then the identity's context matches. (That is, each value of the IdentityContext array is an ORed condition.) In combination with the address of the IPProtocolEndpoint and IKEAction.UseIKEIdentityType, there SHOULD be 1 and only 1 IKEIdentity. The property is defined as follows:

| DESCRIPTION | The IKE service of a security endpoint may have |
|-------------|--|
| | multiple identities for use in different situations. |
| | The combination of the interface (represented by |
| | the IPProtocolEndpoint), the identity type (as |

Jason, et alExpires May-2002[Page 67]

specified in the IKEAction) and the IdentityContexts
selects a unique identity.
SYNTAX string array
VALUE string of the form <ContextName>[&&<ContextName>]*

8.7. The Association Class HostedPeerIdentityTable

The class HostedPeerIdentityTable provides the name scoping relationship for PeerIdentityTable entries in a System. The PeerIdentityTable is weak to the System. The class definition for HostedPeerIdentityTable is as follows:

| NAME | HostedPeerIdentityTable |
|--------------|---|
| DESCRIPTION | The PeerIdentityTable instances are weak (name scoped |
| | by) the owning System. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref System[11]] |
| | <pre>Dependent [ref PeerIdentityTable[0n] [weak]]</pre> |

8.7.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a System instance. The [1..1] cardinality indicates that a PeerIdentityTable instance MUST be associated in a weak relationship with one and only one System instance.

8.7.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to a PeerIdentityTable instance. The [0..n] cardinality indicates that a System instance may be associated with zero or more PeerIdentityTable instances.

8.8. The Aggregation Class PeerIdentityMember

The class PeerIdentityMember aggregates PeerIdentityEntry instances into a PeerIdentityTable. This is a weak aggregation. The class definition for PeerIdentityMember is as follows:

NAME PeerIdentityMember
DESCRIPTION PeerIdentityMember aggregates PeerIdentityEntry
instances into a PeerIdentityTable.
DERIVED FROM MemberOfCollection (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Collection [ref PeerIdentityTable[1..1]]
Member [ref PeerIdentityEntry [0..n] [weak]]

8.8.1. The Reference Collection

The property Collection is inherited from MemberOfCollection and is overridden to refer to a PeerIdentityTable instance. The [1..1] cardinality indicates that a PeerIdentityEntry instance MUST be

Jason, et al

Expires May-2002

[Page 68]

associated with one and only one PeerIdentityTable instance (i.e., PeerIdentityEntry instances are not shared across PeerIdentityTables).

8.8.2. The Reference Member

The property Member is inherited from MemberOfCollection and is overridden to refer to a PeerIdentityEntry instance. The [0..n] cardinality indicates that a PeerIdentityTable instance may be associated with zero or more PeerIdentityEntry instances.

8.9. The Association Class IKEServicePeerGateway

The class IKEServicePeerGateway provides the association between an IKEService and the list of PeerGateway instances that it uses in negotiating with security gateways. The class definition for IKEServicePeerGateway is as follows:

| NAME | IKEServicePeerGateway |
|--------------|--|
| DESCRIPTION | Associates an IKEService and the list of PeerGateway |
| | instances that it uses in negotiating with security |
| | gateways. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref PeerGateway[0n]] |
| | Dependent [ref IKEService[0n]] |

8.9.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a PeerGateway instance. The [0..n] cardinality indicates that an IKEService instance may be associated with zero or more PeerGateway instances.

8.9.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IKEService instance. The [0..n] cardinality indicates that a PeerGateway instance may be associated with zero or more IKEService instances.

8.10. The Association Class IKEServicePeerIdentityTable

The class IKEServicePeerIdentityTable provides the relationship between an IKEService and a PeerIdentityTable that it uses to map between addresses and identities as required. The class definition for IKEServicePeerIdentityTable is as follows:

NAME IKEServicePeerIdentityTable

DESCRIPTION IKEServicePeerIdentityTable provides the relationship between an IKEService and a PeerIdentityTable that it uses.

DERIVED FROM Dependency (see [CIMCORE])

Jason, et alExpires May-2002[Page 69]

ABSTRACT FALSE PROPERTIES Antecedent [ref PeerIdentityTable[0..n]] Dependent [ref IKEService[0..n]]

8.10.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a PeerIdentityTable instance. The [0..n] cardinality indicates that an IKEService instance may be associated with zero or more PeerIdentityTable instances.

8.10.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IKEService instance. The [0..n] cardinality indicates that a PeerIdentityTable instance may be associated with zero or more IKEService instances.

8.11. The Association Class IKEAutostartSetting

The class IKEAutostartSetting associates an AutostartIKESetting with an IKEService that may use it to automatically start an IKE negotiation or create a static SA. The class definition for IKEAutostartSetting is as follows:

NAME IKEAutostartSetting DESCRIPTION Associates a AutostartIKESetting with an IKEService. DERIVED FROM ElementSetting (see [CIMCORE]) ABSTRACT FALSE PROPERTIES Element [ref IKEService[0..n]] Setting [ref AutostartIKESetting[0..n]]

8.11.1. The Reference Element

The property Element is inherited from ElementSetting and is overridden to refer to an IKEService instance. The [0..n] cardinality indicates an AutostartIKESetting instance may be associated with zero or more IKEService instances.

8.11.2. The Reference Setting

The property Setting is inherited from ElementSetting and is overridden to refer to an AutostartIKESetting instance. The [0..n] cardinality indicates that an IKEService instance may be associated with zero or more AutostartIKESetting instances.

8.12. The Aggregation Class AutostartIKESettingContext

The class AutostartIKESettingContext aggregates the settings used to

automatically start negotiations or create a static SA into a configuration set. The class definition for AutostartIKESettingContext is as follows:

Jason, et al

Expires May-2002

[Page 70]

| Internet Draft | IPsec Configuration Policy Model November 2001 |
|----------------|---|
| | |
| NAME | AutostartIKESettingContext |
| DESCRIPTION | AutostartIKESettingContext aggregates the |
| | AutostartIKESetting instances into a configuration set. |
| DERIVED FROM | SystemSettingContext (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Context [ref AutostartIKEConfiguration [0n]] |
| | Setting [ref AutostartIKESetting [0n]] |
| | SequenceNumber |

8.12.1. The Reference Context

The property Context is inherited from SystemSettingContext and is overridden to refer to an AutostartIKEConfiguration instance. The [0..n] cardinality indicates that an AutostartIKESetting instance may be associated with zero or more AutostartIKEConfiguration instances (i.e., a setting may be in multiple configuration sets).

8.12.2. The Reference Setting

The property Setting is inherited from SystemSettingContext and is overridden to refer to an AutostartIKESetting instance. The [0...] cardinality indicates that an AutostartIKEConfiguration instance may be associated with zero or more AutostartIKESetting instances.

8.12.3. The Property SequenceNumber

The property SequenceNumber specifies indicates the ordering to be used when starting negotiations or creating a static SA. A zero value indicates that order is not significant and settings may be applied in parallel with other settings. All other settings in the configuration are executed in sequence from lower values to high. Sequence numbers need not be unique in an AutostartIKEConfiguration and order is not significant for settings with the same sequence number. The property is defined as follows:

SequenceNumber NAME DESCRIPTION The sequence in which the settings are applied within a configuration set. SYNTAX unsigned 16-bit integer

8.13. The Association Class IKEServiceForEndpoint

The class IKEServiceForEndpoint provides the association showing which IKE service, if any, provides IKE negotiation services for which network interfaces. The class definition for IKEServiceForEndpoint is as follows:

IKEServiceForEndpoint NAME DESCRIPTION Associates an IPProtocolEndpoint with an IKEService that provides negotiation services for the endpoint.DERIVED FROMDependency (see [CIMCORE])ABSTRACTFALSE

Jason, et al

Expires May-2002

[Page 71]

PROPERTIES Antecedent [ref IKEService[0..1]] Dependent [ref IPProtocolEndpoint[0..n]]

8.13.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to an IKEService instance. The [0..1] cardinality indicates that an IPProtocolEndpoint instance MUST by associated with at most one IKEService instance.

8.13.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IPProtocolEndpoint that is associated with at most one IKEService. The [0..n] cardinality indicates an IKEService instance may be associated with zero or more IPProtocolEndpoint instances.

8.14. The Association Class IKEAutostartConfiguration

The class IKEAutostartConfiguration provides the relationship between an IKEService and a configuration set that it uses to automatically start a set of SAs. The class definition for IKEAutostartConfiguration is as follows:

NAME IKEAutostartConfiguration
DESCRIPTION IKEAutostartConfiguration provides the relationship
between an IKEService and an AutostartIKEConfiguration
that it uses to automatically start a set of SAs.
DERIVED FROM Dependency (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Antecedent [ref AutostartIKEConfiguration [0..n]]
Dependent [ref IKEService [0..n]]
Active

8.14.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to an AutostartIKEConfiguration instance. The [0..n] cardinality indicates that an IKEService instance may be associated with zero or more AutostartIKEConfiguration instances.

8.14.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IKEService instance. The [0..n] cardinality indicates that an AutostartIKEConfiguration instance may be associated with zero or more IKEService instances.

8.14.3. The Property Active

The property Active specifies indicates whether the AutostartIKEConfiguration set is currently active for the associated

Jason, et alExpires May-2002[Page 72]

IKEService. That is, at boot time, the active configuration is used to automatically start IKE negotiations and create static SAs. The property is defined as follows:

| NAME | Active |
|-------------|---|
| DESCRIPTION | Active indicates whether the AutostartIKEConfiguration |
| | set is currently active for the associated IKEService. |
| SYNTAX | boolean |
| VALUE | true - AutostartIKEConfiguration is currently active |
| | for associated IKEService. |
| | false - AutostartIKEConfiguration is currently inactive |
| | for associated IKEService. |

8.15. The Association Class IKEUsesCredentialManagementService

The class IKEUsesCredentialManagementService defines the set of CredentialManagementService(s) that are trusted sources of credentials for IKE phase 1 negotiations. The class definition for IKEUsesCredentialManagementService is as follows:

| NAME | IKEUsesCredentialManagementService |
|--------------|--|
| DESCRIPTION | Associates the set of CredentialManagementService(s) |
| | that are trusted by the IKEService as sources of |
| | credentials used in IKE phase 1 negotiations. |
| DERIVED FROM | Dependency (see [<u>CIMCORE</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref CredentialManagementService [0n]] |
| | Dependent [ref IKEService [0n]] |

8.15.1. The Reference Antecedent

The property Antecedent is inherited from Dependency and is overridden to refer to a CredentialManagementService instance. The [0..n] cardinality indicates that an IKEService instance may be associated with zero or more CredentialManagementService instances.

8.15.2. The Reference Dependent

The property Dependent is inherited from Dependency and is overridden to refer to an IKEService instance. The [0..n] cardinality indicates that a CredentialManagementService instance may be associated with zero or more IKEService instances.

8.16. The Association Class EndpointHasLocalIKEIdentity

The class EndpointHasLocalIKEIdentity associates an IPProtocolEndpoint with a set of IKEIdentity instances that may be used in negotiating security associations on the endpoint. An IKEIdentity MUST be associated with either an IPProtocolEndpoint

using this association or with a collection of IKEIdentity instances using the CollectionHasLocalIKEIdentity association. The class definition for EndpointHasLocalIKEIdentity is as follows:

Jason, et al

Expires May-2002

[Page 73]

| Internet Draft | IPsec Configuration Policy Model November 2001 |

| | |
| NAME | EndpointHasLocalIKEIdentity |
| DESCRIPTION | EndpointHasLocalIKEIdentity associates an |
| | IPProtocolEndpoint with a set of IKEIdentity instances. |
| DERIVED FROM | ElementAsUser (see [<u>CIMUSER</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref IPProtocolEndpoint [01]] |

Dependent [ref IKEIdentity [0..n]]

8.16.1. The Reference Antecedent

The property Antecedent is inherited from ElementAsUser and is overridden to refer to an IPProtocolEndpoint instance. The [0..1] cardinality indicates that an IKEIdentity instance MUST be associated with at most one IPProtocolEndpoint instance.

8.16.2. The Reference Dependent

The property Dependent is inherited from ElementAsUser and is overridden to refer to an IKEIdentity instance. The [0..n] cardinality indicates that an IPProtocolEndpoint instance may be associated with zero or more IKEIdentity instances.

8.17. The Association Class CollectionHasLocalIKEIdentity

The class CollectionHasLocalIKEIdentity associates a Collection of IPProtocolEndpoint instances with a set of IKEIdentity instances that may be used in negotiating SAs for endpoints in the collection. An IKEIdentity MUST be associated with either an IPProtocolEndpoint using the EndpointHasLocalIKEIdentity association or with a collection of IKEIdentity instances using this association. The class definition for CollectionHasLocalIKEIdentity is as follows:

| NAME | CollectionHasLocalIKEIdentity |
|--------------|---|
| DESCRIPTION | CollectionHasLocalIKEIdentity associates a collection |
| | of IPProtocolEndpoint instances with a set of |
| | IKEIdentity instances. |
| DERIVED FROM | ElementAsUser (see [<u>CIMUSER</u>]) |
| ABSTRACT | FALSE |
| PROPERTIES | Antecedent [ref Collection [01]] |
| | Dependent [ref IKEIdentity [0n]] |

8.17.1. The Reference Antecedent

The property Antecedent is inherited from ElementAsUser and is overridden to refer to a Collection instance. The [0..1] cardinality indicates that an IKEIdentity instance MUST be associated with at most one Collection instance.

8.17.2. The Reference Dependent

The property Dependent is inherited from ElementAsUser and is overridden to refer to an IKEIdentity instance. The [0..n]

Jason, et al Expires May-2002

[Page 74]

cardinality indicates that a Collection instance may be associated with zero or more IKEIdentity instances.

8.18. The Association Class IKEIdentitysCredential

The class IKEIdentitysCredential is an association that relates a set of credentials to their corresponding local IKE Identities. The class definition for IKEIdentitysCredential is as follows:

NAME IKEIdentitysCredential
DESCRIPTION IKEIdentitysCredential associates a set of credentials
to their corresponding local IKEIdentity.
DERIVED FROM UsersCredential (see [CIMCORE])
ABSTRACT FALSE
PROPERTIES Antecedent [ref Credential [0..n]]

<u>10</u>. Security Considerations

This document describes a schema for IPsec policy. It does not detail security requirements for storage or delivery of said schema.

Jason, et alExpires May-2002[Page 79]

Storage and delivery security requirements should be detailed in a comprehensive security policy architecture document.

<u>11</u>. Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11.

Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

12. Acknowledgments

The authors would like to thank Mike Jeronimo, Ylian Saint-Hilaire, Vic Lortz, and William Dixon for their contributions to this IPsec policy model.

Additionally, this draft would not have been possible without the preceding IPsec schema drafts. For that, thanks go out to Rob Adams, Partha Bhattacharya, William Dixon, Roy Pereira, and Raju Rajan.
